note from the editor

I hope you enjoyed a restful week!
I have traveled to my home to spend
a day with those I call family.
Of course, bitcoin comes up at the
gathering table. Followed closely
behind by questions of AI.
What will the future hold for us?
I don't know, but I'll hold bitcoin.

our perpetual thankfulness

What are you thankful for?

AHAHA! I'm so pissed I missed that typo in the title! Or, maybe I really meant to do it?

Memories Of Zuccotti Park

I was organizing old photos the other night when I came across a few which I took while visiting Zuccotti Park almost exactly 14 years ago. It was right at the end of the "Occupy Wall Street" protests. I was working in lower Manhattan that day, so I spent some time roaming around the site. Excuse the poor resolution. I was probably using some early Motorola android phone to take them. To put things in context, this was a few years after the news headline that inspired Satoshi's genesis block inscription:

It was pretty sad.

The space itself was much smaller than what I expected from watching the protests on television. It was a cold, rainy, November day. Most of the crowd had makeshift rain ponchos. A few of them were willing to talk. It was a far cry from the well funded, performative and destructive productions we have gotten used to watching from Soros, Inc. The protesters all stood inside the cage erected around the park by the NYPD. There were some handwritten signs and some chants complaining about the bailouts. I noticed a few old gray ponytailed hippies trying to distribute their socialist pamphlets, but from the accents I could tell that most of these people were local New Yorkers. Many had lost their homes to foreclosure recently. They couldn't comprehend why they didn't get a bailout along with the banks. It was a polite, pathetic little scene. They were like zoo animals in their cages.

How I Talk Bitcoin to Friends and Family During Thanksgiving

3423 sats \ 27 comments \ @denillaapan 27 nov 2024

"I don't."

Happy Thanksgiving from America

195 sats \ 5 comments \ @dez 23 nov 2022 bitcoin

"Wild times out there but I hope all my friends are being safe, and controlling their own funds!"

- continued -

Zuccotti Park wasn't originally chosen as the site for the protests. The police herded people there so that Wall Street's business could continue uninterrupted. Soon though, the park was embraced by the movement because of its location, its legal status, and its historical significance.

First of all, it was a POPS, a privately owned public space.

The property owner is required by local zoning laws to keep it open to the public. These spaces are maintained by owners who were granted concessions by the municipality, like height restriction waivers and property tax breaks- the perfect product of crony capitalism. It is quasi private, kind of like the way the Federal Reserve is often described. Because it is a public space, no one could be accused of trespassing, and the park never closed. People began sleeping there overnight.

United States Steel originally built the park, then called Liberty Plaza Park, in exchange for the rights to demolish older buildings and erect a fifty four story skyscraper nearby. The name was changed after the park was heavily damaged in the September 11 attacks.

At the time of the protests, Zuccotti Park was owned by Brookfield Properties. Thanks to the TARP Program, Brookfield recovered quickly from the financial crisis and was soon thriving, enjoying those near zero percent interest rates that continued all the way to 2015.

The (soon to be former) homeowners I saw wearing ponchos that day didn't have a spot at the Cantillon trough.

The Site's Historical Significance

Zuccotti Park is the site of the first coffeehouse to open in Colonial America. It was called The King's Arms, and opened in 1696. On November 5, 1773, the Sons Of Liberty organized a large protest of the Tea Act in front of the coffeehouse. This may have been the first public protest of the tax. Months later New York had its own small tea party.

Larry Fink

Larry Fink and BlackRock spearheaded the bailouts that Satoshi memorialized and these people were protesting against.

Before forming BlackRock, Fink had traded mortgage backed securities (MBS) at First Boston. Some of these products were the toxic assets that were a catalyst of the financial crisis. Who better than him to solve the problem? BlackRock was hired by the U.S. government to analyze and manage the bailout of major financial institutions- the fox guarding the hen house. By this point Fink was the ultimate political and financial insider. Larry did express sympathy for the poor suckers who actually had to suffer while he and his buddies grew richer:

"We have to admit, as members of the financial press and the financial community...Washington...we really did let down a lot of people... To resolve this we have to admit it."

What did he do to resolve it? Nothing. Instead, BlackRock's power grew. When Hillary Clinton ran as the democratic nominee against Donald Trump in 2016, Larry Fink was expected to be named Treasury Secretary if she had won the election.

Remember covid? Remember how the entire economy shut down, except for those the government decided could keep operating? Guess who advised the federal reserve on their asset buying program? Yep. Larry and BlackRock.

Billionaire investor Sam Zell once said
"I didn't know Larry Fink had been made God..."

Today, BlackRock is the world's largest asset manager. They manage funds for companies, pension funds, and governments. It is the largest shareholder in many S&P 500 companies. It advises central banks throughout the world.

Larry once called bitcoin "the domain of money launderers and thieves." Now he likes it. In fact, he likes it so much that BlackRock's bitcoin ETF is the largest bitcoin ETF, by far.

Welcome To The Machine

Many of us in the bitcoin community have embraced these ETFs. It's a real hassle having to custody your own bitcoin. Coinbase is reputable.

We're sure they have the bitcoin they say they have. This is what adoption looks like.

< keep reading....let him cook >

Many of us in the community have no problem with bitcoin treasury companies either. Like Saylor says, who needs those crazy anarchist cypherpunks and their “hold your own keys” stuff? Embracing Wall Street, with its futures contracts, options, margin loans and derivatives is what adoption looks like.

Many of us in the bitcoin community have no problem begging the US government to embrace bitcoin. We can trust the government, right? This is what adoption looks like. We can trust Trump, right? What’s a few shitcoin rugpulls among friends? This is what adoption looks like.

Bullshit.

You want Larry in charge? Four D chess? Don’t underestimate the guy sitting across the table from you. The Trojan Horse? Remember, that was myth, not history.

Bitcoin will survive and thrive, but that’s not the point. Why embrace the system that bitcoin was created to destroy? Start using it as money, not as a plaything for financiers. Help build a new system from the ground up. Don’t worry about Larry. He still has those eth ETFs. He’ll survive too.

144 sats \ 2 replies \ @billytheked 25 Nov

Bitcoin subculture is as significant as its moneyness.

Did Hip-hop, punk, heavy metal ‘Trojan horse’ popular music culture? Or did they just get subsumed, shackled, as it were?

Did the Beat Generation ‘Trojan horse’ popular media? Or did they all drink themselves to death or otherwise sell out?

I guess your answer to these questions are indicative of where you think Bitcoin subculture is headed.

Cronyism might be par for the course if we accept it as money, while, at the same time being unacceptable to the subversive ethos that brought it to be.

36 sats \ 0 replies \ @SimpleStacker 25 Nov

Great write up. In my personal life I’ve found that the number of people who want to use bitcoin as a medium of exchange, as opposed to simply an investment vehicle, is a subset of a subset. Even the people who I meet who like bitcoin more often than not only care about the price.

We’re an extreme minority here on SN, and I wonder if SNs lack of growth reflects that reality.

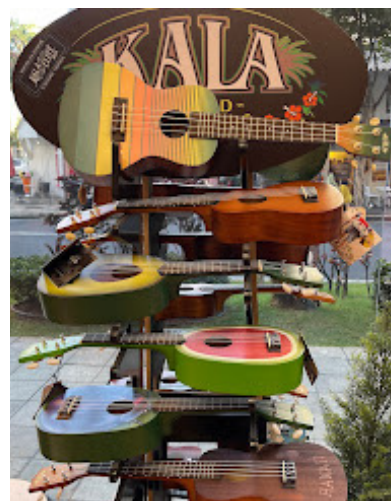

My second shop to pay with lightning in Hawaii

1190 sats \ 17 comments \ @south_korea_In 25 Nov lightning

Bought two ukuleles here today.

Found them thanks to btcmaps.

The cashier didn’t know what i was talking about when asking to pay with Bitcoin, luckily her husband (?) did. No Bitcoin stickers here, unlike the previous place i mentioned buying coffee (#1286879). They told me i was the first one to pay with Bitcoin. I’ll maybe send them a follow up email to make sure they understand what they enabled. Even though this time, i had to use my custodial wallet of satoshi wallet, didn’t have enough sats with Phoenix.

Payment Detail

Time
Tuesday, November 25, 2025 4:56 PM

Amount (sats)
83,515

Fiat
about \$73

Type
LIGHTNING NETWORK PAYMENT

Status
PAID

Total Fees (sats)
0

Note
Best Hawaiian Ukulele Co.

I paid two more invoices after for smaller amounts, and she pulled up the invoices without a problem. So she’ll know what to do next time ;)

Axiom-of-Resistance

There is a famous quote from Satoshi where he says

> Governments are good at cutting off the heads of a centrally controlled networks like Napster, but pure P2P networks like Gnutella and Tor seem to be holding their own.

There's a lot in that last little phrase
"seem to be holding their own."

Satoshi believed it was possible to build something that could “hold its own” against the power of the state. This is no small claim and, as you can see, even Satoshi wasn’t fully sure of it: P2P networks only “seem” to be holding their own. It’s not like we can prove it.

The truth is, we can never really know if it will be true tomorrow. Bitcoin is based on this hope that we can resist the state, but there's no reason this has to be true. We just have the somewhat shaky evidence that governments don't seem to be able to squash networks with certain qualities.

It's possible that they just haven't wanted to.

There is no promised land

It doesn't get said very often, but Bitcoin comes with no guarantees. You may have noticed that when you fired up your node, there wasn't a EULA nor did you have to check a little box saying that you agreed to the terms and conditions (if you did, consider using different node software).

Neither is there a buyer of last resort when it comes to Bitcoin. If most people demand some stupid shitcoin instead of bitcoin, or if they all just want to buy stonks and hold fiat, there is no insurance that will prevent you from losing the value you are trying to keep in bitcoin.

Likewise, if you lose your keys, there is no number to call that will get them back. And if you screwed something up when you created your wallet or sent your transaction, it's on you.

And if the state turns its malevolent eye towards Bitcoin, maybe it will be able to squash it. Maybe they'll print money to buy miners and get a majority of hashrate or maybe they'll just put their finger on the centralizing pressures of mining that already exist so they can have a nice easy target for when they want to attack Bitcoin. Perhaps the state will impose such draconian punishments on the self-sovereign use of Bitcoin that most people abandon it.

Bitcoin is a good money for those in the wilderness

We hold on to our dreams of a world where bankers don't get bailouts and politicians can't sneak our savings by printing money for their friends, and the crowd of confident Bitcoin boosters who write books have documented 1,000 reasons why Bitcoin is economically and politically certain to end the fiat game. As they say: *nothing stops this train*.

But that's just something we take on faith.

Resisting the state does not necessarily mean defeating it. It's possible that Bitcoin remains a niche subversive tool, like TOR, something that is only used by punks who dislike the state -- and that could be fabulous outcome, even if it doesn't make us all rich.

I've been reading Cryptoeconomics again, and this is an attempt to work through some of the ideas in the chapter called "Axiom of Resistance"

In modern logic an axiom is a premise, it cannot be proven. It is a starting assumption against which other statements may be proven. For example, in Euclidean geometry one cannot prove that parallel lines never meet. It defines the particular geometry.

Proving statements about Bitcoin requires reliance on axiomatic systems, specifically mathematics, probability, and catalactics, and therefore the assumptions upon which they rely. However Bitcoin also relies on an axiom found in these systems. Satoshi alludes to this in an early statement:

You will not find a solution to political problems in cryptography.

Yes, but we can win a major battle in the arms race and gain a new territory of freedom for several years.

Governments are good at cutting off the heads of a centrally controlled networks like Napster, but pure P2P networks like Gnutella and Tor seem to be holding their own.

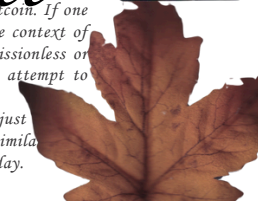

Satoshi Thu Nov 6 15:15:40 EST 2008

In other words there is an assumption that it is possible for a system to resist state control. This is not accepted as a fact but deemed to be a reasonable assumption, due to the behavior of similar systems, on which to base the system.

One who does not accept the axiom of resistance is contemplating an entirely different system than Bitcoin. If one assumes it is not possible for a system to resist state controls, conclusions do not make sense in the context of Bitcoin - just as conclusions in spherical geometry contradict Euclidean. How can Bitcoin be permissionless or censorship-resistant without the axiom? The contradiction leads one to make obvious errors in an attempt to rationalize the conflict.

It is common for people to refer cynically to a Bitcoin-like system that omits the resistance axiom as just "PayPal", a designation not without merit. Confinity originally attempted to create a system with a similar proposition to Bitcoin. Having failed to do so it discarded the axiom, building the PayPal we know today.

My trip to Tokyo Bitcoin Base

2926 sats \ 19 comments \ @SimpleStacker 26 Nov bitcoin

I'm on vacation in Japan and got a chance to visit the Tokyo Bitcoin Base. We didn't originally have it planned in the itinerary, but by a stroke of (bad?) luck, events outside our control led us to cancel an entire day's activities. That gave me some time to explore Tokyo freely, and I made it a point to check out the Tokyo Bitcoin Base, as well as go for some nice coffee and check out the Nintendo store, haha

So the Tokyo Bitcoin Base is a coworking space that I suppose houses some bitcoin companies. I'm not really sure, because I couldn't read the Japanese on the website and didn't really talk to anyone at the place. But they have a wall with a bunch company logos, so I suppose at least some of them must have employees who work here? The mailbox also says Blockstream on it, so I guess this is Blockstream's official Tokyo office?

Anyway, it was a rainy day so there weren't too many people around. There were no tourists hanging around outside, and there was just one guy in the lounge. He seemed absorbed reading something so I didn't bother him.

The main attraction is the Satoshi statue. Why Satoshi has come to be associated with a hoodie hacker is anyone's guess, but I guess this is Satoshi. The cool thing about the statue is that he becomes invisible as you walk by at a certain angle. Nice touch. Again, not entirely sure what the invisibility has to do with Bitcoin, but it's cool.

Inside on the first floor is a lounge space, already pictured above. It's got a variety of bitcoin related paraphernalia, including copies of Bitcoin Magazine, hardcover copies of Saif's *The Bitcoin Standard* and *Principles of Economics*, "Here Comes Bitcoin" plushies, and other stuff.

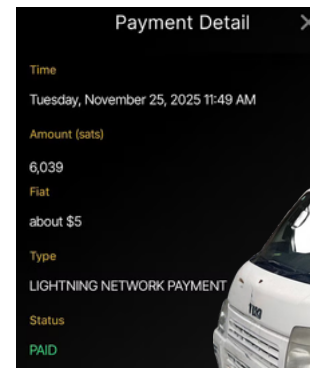

They also have this fairly cool mining setup, in which the heat given off by an array of solar-powered BitAxes is used to support an aquaponics ecosystem. Sovereign tech, indeed!

I didn't explore much beyond this lounge area. There wasn't anyone around to greet me or show me around. There were some people who seemed busy moving stuff in and out, so I didn't bother them. One person did ask me if I'm here to look around, and I said yes, and he just explained that it's a coworking space and that the first floor is a lounge, so I just assumed that there weren't any other exhibits beyond what I already saw on the first floor.

Parked outside the office was a food truck called "Cocorotus". If you search Tokyo in btcmap.org, you'll see Cocorotus everywhere. Apparently, it is a food truck chain that has embraced bitcoin. I couldn't miss this opportunity to spend bitcoin in-person, so I ordered their Singaporean chicken rice. The server was friendly and could tell by the look on my face that I wanted to pay in bitcoin. He showed me the QR code which opened a LN address, and I paid using Wallet of Satoshi, about 6,000 sats (¥800/\$5). It was smooth as butter, but I did reflect on this post (#1272936), since instead of using a lightning invoice they had me enter the amount of sats myself. I wonder if I entered 600 and

then just quickly showed him my confirmation screen, whether I could have scammed him.

Anyway, that's pretty much it for my bitcoin adventure in Japan. Besides this place, I haven't seen anything else bitcoin related yet. I did get to touch grass and snap some wicked photos of Mt. Fuji the next day though, haha.
