Using Bitcoin Miners to Make Maple Syrup

11.6k sats \ 29 comments \ @revhod121 27 Sep
Permaculture

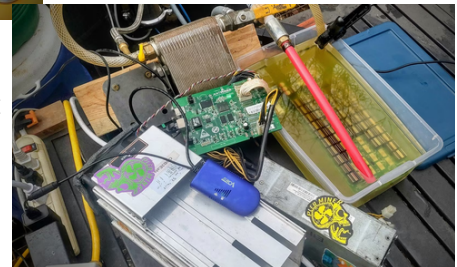

Immersion mining with canola oil to concentrate maple sap more quickly

I'm using a single S9 hash board immersed in canola oil to heat maple sap to increase the effectiveness of the reverse osmosis sap concentration system.

The weather conditions this season have caused the maple sap to be cold and stay cold which drastically slows down the ability of the RO system to filter water out of it. I ran into a bottle neck where there is more sap than I can keep up with concentrating so I needed to come up with something quickly!

Ideally if the temperature of the sap is 77°F the filter will operate most effectively without damaging the RO membrane. Of course, my mind immediately turned to Bitcoin mining for the heating solution. What I came up with was an immersion system using the homebrew equipment I already had to heat the sap just before it entered the RO. This would allow the majority of the sap to stay cool keeping it from spoiling and still remove the most water possible.

421 sats \ 2 replies \ @Chikasunbeats 28 Sep

This is brilliant. In Nigeria we have palm oil everywhere, literally cheaper than canola. I wonder if palm oil would work for immersion? It has higher smoke point. Has anyone tried it? Might be a way to recycle used palm oil from kitchens to cool miners and then... heat water. Two birds.

Trip Report:

Paris

11.8k sats \ 11 comments \ @leo 28 Sep Travel

Paris is known for its food and savoir vivre, the art of living your life. It comes as no surprise that the merchants I found accepting Bitcoin in Paris are all serving foods and drinks, and so this trip report is almost more of a food review than a Bitcoin review.

🍷 In the hip 18th arrondissement lies Chez Ginette, a fairly typical cafe with its seats facing the trottoir, so Parisians can watch each other. The menu offers all the classic dishes you would expect from a place like this, but somehow lacks a theme or specialization. I order the greatest classic there is, the steak tartare. It comes préparé, meaning the raw egg is mixed in. It's definitely of high quality and I'm also happy about the pommes frites on the side. There is a "Bitcoin Lightning payments accepted" sticker on the door, and as I ask to pay with Bitcoin the waiter does not hesitate, although it takes him a while to get his colleague to come over with an orange point of sale terminal running the Swiss Bitcoin Pay app, built on BTCPay. The payment goes through almost instantly.

🍷 Le Greffulhe is another cafe close to the opera and a high-end fashion district. As I arrive I mistake a man standing by the entrance for staff and ask him about Bitcoin payments. He says he would be surprised if they did, and indeed he is after we go inside together to ask the cashier. The cafe belongs to the same category as Chez Ginette, but the atmosphere feels very different, and although they do serve food, I never got the chance to try it during my two visits. Instead I had Aperol Spritz and Campari Soda, and payments went smoothly to the mobile phone of the cashier, also running Swiss Bitcoin Pay.

🍷 Undoubtedly the heart of the Paris Bitcoin community is N'importe Quoi near Les Halles, somewhat in the geographical center of the city. The dive bar has the kind of anarchic and old-school feminist feel of a place that you almost expect to be taking Bitcoin. I'm here quite early and all by myself, and at first the bar tender denies my Bitcoin payment, saying "usually we do." Eventually she shows mercy with me and digs up the phone that has fallen somewhere behind the cash register, presumably only kept for the sole purpose of processing Bitcoin payments.

The bar also uses Swiss Bitcoin Pay, and I'm quite pleased with how fast I can find a route to their node, and how I never paid more than 0.09% in fees, just a few sats.

🍷 The Italian restaurant Costa d'Amalfi greets visitors with a warning: No Pizza. Connoisseurs will recognize this as a sign of quality, and indeed the family-run trattoria is exactly the kind of place you typically see accepting Bitcoin in Italy. Everything is well curated, the menu is short and specializes in one thing: truffle dishes. The owner comes over to talk to me about Bitcoin, telling me stories of his family and his Bitcoin story. He also uses the now familiar Swiss Bitcoin Pay and is quite happy with it.

🍷 Located near Volontaires, an homage to the volunteer soldiers of the French Revolution, is one of the areas of Paris known for their contemporary bohème lifestyle. Le Drapeau de la Fidélité fits it perfectly with its nondescript facade and carefully curated interior. There are plenty of books that make the restaurant feel more like a library, and they appear to have actually been read frequently. There are antiques, paintings, signed letters and a banner proclaiming a "Universal Humanist Capitalist Society" that I cannot find any other information about. The owner, a well-dressed older Vietnamese gentleman appears to run the tiny restaurant with its maybe 12 seats together with his son. The menu is short and the dishes simple and affordable. I order the porc caramélisé and pay a round 18,000 satoshi. The owner seems quite pleased with me paying with Bitcoin, which is always a great feeling when spending it. He uses Cake wallet, but doesn't know how to set an amount for his invoices. Also, his wallet is priced in USD, meaning I have to look up the rate on my end. As far as routing fees go, it's by far my most expensive payment at 0.3%.

🍷 Near the Gare d'Austerlitz I visit La Brasserie L'Audièrnes. The area seems to be very popular with students, and everyone at the bar seems to be talking about AI, with many conversations in English. I order my drink at the bar and pay right away, but the cashier is hesitant to show me his wallet, and instead asks his colleague over. We navigate through the interface of some unfamiliar crypto wallet, and all we can find is an onchain address, which I pay to reluctantly.

I'm quite happy with my visit to Paris and especially the Bitcoin places that I found. I love the opportunity to find some random or hidden gems in the city that I would have never been able to visit if it weren't for Bitcoin. I love talking to the staff and the owners, there is always something to learn, and sometimes to teach, about how people are using Bitcoin. I also went to six other places, four of which were closed, and two of which no longer accept Bitcoin. At one of these places, the doors and cash register covered in Bitcoin stickers, I was practically laughed at for asking to pay with Bitcoin, before being asked to pay one Bitcoin to buy everyone a round. Finally one reason to implement BIP 177.

Research in Public #20:

Stacker News paper accepted at WISE 2026

22.9k sats \ 29 comments \ [@SimpleStacker](#) 29 Sep econ meta

Almost exactly one year ago, I proposed to do a research paper using Stacker News data (#1243188) and to do so in public, with all the code available in a public github repo, and regular public updates on the progress of the research.

The first set of results were finished in around December 2025, and since then I've been trying to get it accepted at conferences and journals. Unfortunately, the track record was not great. A Bitcoin research conference did not take it (no reason given), the Journal of Economic Behavior and Organization did not take it (too niche), and Electronics Commerce Research and Applications did not take it (I don't write like an IS scholar).

But, I'm pleased to say that finally we are having some success. The paper was just accepted to the Workshop on Information Systems and Economics, which will be held in Lisbon, Portugal this December. This is one of the main conferences for economists studying information systems, and the program looks super interesting. I think this is the right group of people to try and get this work in front of, and I'm looking forward to the feedback I get -- as well as the exposure Stacker News may receive from other researchers.

If you're interested, you can read a working draft of the paper [here](#)

River is forcing new terms that severely restrict account holder options

18.1k sats \ 21 comments \ [@87587bb284](#) 29 Sep bitcoin

- **Lead Bank can freeze, restrict, or close the USD account with broad discretion, including with little or no advance notice where permitted by law.** In practical terms, the bank can shut off access to your dollars first and resolve the dispute afterward.
- **Withdrawals and transfers are conditional, not absolute.** Access to your own cash is subject to Lead's eligibility rules, transaction limits, compliance controls, and fraud/risk determinations.
- **If Lead closes the account, you may have to wait for your remaining balance to be returned.** The agreement allows Lead to hold funds through closure and return them within a "reasonable period," rather than guaranteeing immediate access.
- **The default dispute process is mandatory individual arbitration.** Unless you opt out within the limited window, you give up ordinary court litigation for most disputes, cannot bring a class action, and must proceed through JAMS arbitration.
- **Arbitration shifts leverage toward the bank.** Proceedings are private, class claims are barred, fees can include your share of arbitrator costs, and judicial review of an arbitration award is very limited.
- **Even opting out does not fully restore normal legal recourse.** The agreement separately waives jury trial and generally requires court disputes to be brought in Kansas City, Missouri.
- **The burden is on the account holder to notice and act.** If you accept the agreement and miss the arbitration opt-out deadline, the more restrictive dispute process becomes binding by default.

These regulations only apply to USD balances, right? I'm pretty sure that none of this applies to BTC balances held on River.

101 sats \ 0 replies \ [@anon](#) 29 Sep

I left them \$10 in my account after several changes to their terms and conditions. Seems it's getting worse! The river is full of 🐼 now smh

BITCOIN

adoption story

19.8k sats \ 33 comments \ @hynek 29 Sep AGORA

Lately, I haven't been able to find time for meetups because of family and work, so I decided to focus on lunches instead. In a regular local pub, I asked the owner if he'd be willing to accept Bitcoin. He politely declined.

I kept going there about once a week. After a few visits, I made an NFC card and loaded it with 1,000 sats as a tip. I also gave him a leaflet with instructions on how to access the Bitcoin. He's an older gentleman, not very interested in technology, and doesn't have much time for experiments while running the place. The following week, I tipped him another 1,000 sats. On the third week, he finally agreed to let me install a mobile wallet app for him.

Suddenly, he had a bit of Bitcoin in his Wallet of Satoshi. I asked him if I could start paying that way – with the promise that if it didn't work out, I'd exchange it back into cash for him. He wasn't too keen at first, but since I was a regular, he wanted to make me happy.

From that moment, I announced in the local Jednadvacet (our Czech version of Einundzwanzig) community that we'd meet for lunch every Thursday. A short meetup – a chance to exchange Bitcoin, learn something new, meet people, etc. The only condition: payment must be in Bitcoin.

Two months have passed since then. The group has been growing. At first, there were just three of us. Last time, there were already seventeen. For the owner, it's become a significant part of that day's revenue. He's started treating us better too – now he greets us from afar and even reserves the biggest table for us every Thursday, not letting anyone else sit there.

Every time I ask him if everything's okay, if he wants to cash out, or needs any help with it. And you know what he told me last time? That he doesn't need to – it's growing nicely in Bitcoin. He even recently bought a fridge with Bitcoin. He said he had to use Lightning because he ran into some issues with on-chain. I never even mentioned the word "Lightning" to him. He's been learning on his own, and now he's become quite the Bitcoiner.

It looks like the pub might soon turn into a nice little vext point – a place where people can exchange Bitcoin for dirty fiat and vice versa.

I'm writing this because I think it's a great blueprint. It's short, takes me about an hour a week – time I'd spend on lunch anyway – I meet people, and it helps Bitcoin adoption in a very natural way. Hopefully, it'll inspire more Bitcoiners to try something similar in their own area.

I remember this story before. How has he been doing? Still accepting sats now?

54 sats \ 1 reply \ @hynek OP 29 Sep

Yes, we visit his pub every week. Always various people. He started to use bitcoin for his own payments. And when he feels that he has too much bitcoin he swaps it with some customer to fiat. He is still kind of normie, but now using bitcoin daily.

He is also asking for more options for using bitcoin, so I work on onboarding even harder. Currently having two nice tools for that.. I will write a dedicated post on them.

Do you still do bitcoin lunches at this place?

It's a great story. Thanks for sharing!

108 sats \ 1 reply \ @hynek OP 29 Sep

Yes, every Thursday 😊

What is your favorite paradox?

7004 sats \ 35 comments \ @SimpleStacker 30 Sep math

AskSN the_stack_muse

mathematical, logical, philosophical, economical, or otherwise: what is your favorite paradox?

Mine is the Ship of Theseus. It goes something like this:

Every year the Athenians sail the Ship of Theseus to the island of Delos to worship their God Apollo. After every voyage, any planks that had been worn out from the voyage are replaced by new planks. After many years, none of the original planks remain. What's more, it's discovered that a shipwright had been quietly saving and restoring the discarded planks and he used them to rebuild the original ship plank for plank. Which ship is the Ship of Theseus?

The reason I like this one is because it asks about the meaning of identity, and the continuity of it. It's inspired a lot of fiction, like Star Trek's transporter episodes, The Prestige, and Klara and the Sun. It's also not an abstract logical paradox - it is easily envisioned and explained in real world terms, but it doesn't admit a clean solution.

I have a major soft spot for Zeno's Paradoxes.

I particularly like the framing of the foot race. How can you ever catch up to a slower runner, if every time you get to where they had been, they've moved farther along?

The Fermi Paradox

(alleged, and first mentioned in this paper from Carl Sagan)

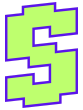

Shielded Bitcoin & PIPEs:

12 Questions & Answers

- BTC++ Insider Edition

7515 sats \ 8 comments \ @Scoresby 30 Sep
bitcoin privacy

Shielded Bitcoin was announced by [[alloc] Init] (they really need to get a handle on all the brackets in their name) a few days ago. [#1580989](#) [#1427029](#) [#1583163](#)

It's exciting to see new privacy ideas like this and Babilonia [#1565564](#) and Glass Coins [#1556346](#) but I've also found it fairly difficult to wrap my head around the differences in each of these proposals.

So, I found really helpful this approach that Insider Edition has taken here with Clara Shikhelman (one of the people who has worked on Shielded Bitcoin), organizing her explanation of Shielded Bitcoin by addressing various criticisms people have raised in response to its publication.

Insider Edition's newsletter on the topic is excellent and filled with lots of great details, but it is also quite long. I've taken the liberty of summarizing it a bit and re-arranging the numbered list of criticisms they address. (That's why numbers are out of order below).

12: Does Bitcoin need a soft fork for any of this?

< No. Shielded Bitcoin applies its own metaprotocol rules to data published and ordered by Bitcoin. No new opcodes, consensus changes, or soft forks are required.

2: What is Shielded Bitcoin if it's not L1, an L2, or a sidechain?

As far as a Bitcoin node is concerned, Shielded Bitcoin doesn't exist as any more than ordinals exist. Bitcoin still just sees transactions with inputs and outputs in blocks.

< Shielded Bitcoin is not part of Bitcoin consensus: Bitcoin nodes validate the underlying Bitcoin transactions, not Shielded Bitcoin's private transfer rules.

Shikhelman describes it as a Bitcoin metaprotocol. While she don't make the comparison, other metaprotocols that I can think of are Ordinals, RGB, and UTEXO.

< Protocol data is published to and canonically ordered by Bitcoin, while a separate indexer/explorer parses that data to derive the protocol state deterministically.

Unlike ordinals though, Shielded Bitcoin relies on cryptography embedded in witness data to enforce the protocol, so, I believe, your ownership of your BTC in Shielded Bitcoin is enforceable by you and math, rather than by everyone else agreeing to some indexer's version of where everything is at.

4: Isn't it a trusted bridge? Who controls it?

I've seen a number of people asking this question.

Insider Edition answers the question of whether there is a trusted bridge or not like this:

< This objection tends to conflate two very different concepts: trusted setup and trusted operation. **PIPEs does have trusted setup assumptions.** Constructing a PIPE ciphertext involves a one-time 1-of-n multiparty computation (MPC) ceremony, and the ZK proof system may introduce its own setup assumptions. But those participants do not become custodians or operators. They aren't required to remain online, process transactions, approve withdrawals, or exercise ongoing control over users' funds.

...

< Cryptography replaces the role that a trusted operator, committee, or multi-sig would otherwise play. Once the setup is complete, no setup participant is supposed to control the funds or participate in the user flow.

It seems to me that this is a case where the jury is out. I'm certainly not cryptographically savvy enough to evaluate the math, so we will probably need to wait and see what sort of community opinion gets formed about this.

Also, they have not yet published details about the vault (I believe this means the script for the actual utxo in which your bitcoin sits). Here's their reasons for publishing this separately:

< This separation is deliberate because the vault architecture is a substantial protocol design contribution in its own right, with applications beyond Shielded Bitcoin. We believe it warrants dedicated treatment as a separate contribution to Bitcoin research

...

9: Don't PIPEs require 338 TB? How could this possibly be practical?

In question #4 above, a ciphertext is mentioned. This is a large file -- used to be as much as 338 TB, now only 10TB, but I believe the user needs access to this file in an unhappy exit from the system.

< Moving and managing Bitcoin inside a shielded system does not require decrypting a PIPE at all; decryption is primarily needed to exercise the unilateral L1 vault exit mechanism.

Shikhelman suggests that the storage burden of this ciphertext could be solved like this:

< The ciphertext also does not need to be stored by each user. Because it can be public, storage can be outsourced or distributed across inexpensive, high-latency storage infrastructure without introducing an additional trust assumption.

< < more online > >
