The world's first Bitcoin Art Magazine - Genesis Edition

844 sats \ 110k boost \ 9 comments \ @asanoha
14 Oct art

Bitcoin Art Magazine

Greetings everyone, some of you may know me, most
probably do not, but my name is Asanoha and I am a Bitcoin
artist. I have created what I believe to be is the world's first

periodical Bitcoin Art Magazine.

(If anyone here knows of another periodical
Bitcoin art magazine that already exists
or has existed please let me know).

The Genesis Edition pre-sale is now live,

you can order your copy at
<https://bitcoinartmagazine.com>

We have 4 options available:

1. Un-numbered Base Edition Magazine (still
rare af as we will cap it at some point) -
\$33 or \$21 w/ sub
2. Gold-foil Cover Magazine LE /210 - \$269
3. Hardcover Fine Art Book LE /121 - \$469
4. Gold-foil Hardcover Fine Art Book (Patron's
Edition) LE /21 - \$2100 (We only have 4 copies of the Patron's
Edition left for sale!) (All prices do not include shipping)

The cover artwork features FractalEncrypt's Full Node sculpture. The magazine
contains over 150 pages, with more than 50 pages of full-page artwork. The fine
art book contains 136 pages, also with over 50 pages of full-page art. There is a
foreword by Knut Svanholm and Daniel Prince. The magazine and book showcase
the work of Alex Schaefer, Anik Malcolm, Ariel Birdie, Bitcoin Trading Cards, Bitcoin
Apex, Bitko Yinowsky, Brekkie Von Bitcoin, Chiefmonkey, CypherpunkNow, Dustin
Tammell, Gareth Eckley, George Bodine, Gus Grillasco, FractalEncrypt, Kanuto,
Madex, MadMunky, Marcus Connor, Maxis Club, MEAR ONE, Missatoshi_girl,
mx12Art, Modeotec, Pepenardo, Psyfer, Puzzle, Rare Scrilla, RYR, Sea is Medicine,
Studio Zeitwerk, Tommy, Yonat Vaks, Zetra, and Asanoha.

Thank you,
Asanoha

Who Owns, Operates, and Develops Your VPN Matters

- New Research Report

1670 sats \ 11 comments \ @Scoresby 10 Oct privacy

VPNs offer a model of privacy where the user agrees to trust the VPN provider with their internet usage data in return for possibly gaining privacy from their ISP and/or a government.

VPNs are not a magic bullet though and you are still trusting the VPN provider not to store logs on you and not to grant information access to any third party.

Turns out that many of the free VPN providers out there are not your friend.

'New research from ICFP Fellow Benjamin Mixon-Baca finds that eight providers of popular, commercial VPN applications appear to hide the ownership and operations of their services, and contain serious privacy and security issues that put more than 700 million users at risk of authoritarian surveillance. **Three of these providers are linked to the PLA and there is evidence that a Chinese national owns all eight.**'

'to uncover who owns, operates, and develops 32 popular VPNs on the Google Play Store (with more than one billion downloads, collectively). These VPN apps are distributed by 21 seemingly distinct VPN providers and serve users in India, Indonesia, Russia, Pakistan, Saudi Arabia, Turkey, UAE, Bangladesh, Egypt, Algeria, Singapore, and Brazil.'

'Hard-coded passwords in their configuration that are shared across all users: The password is embedded within the source code, instead of stored securely elsewhere and retrieved at runtime. The fact that the password credentials are in the app code itself, makes them easily accessible to anyone who can view the code. An attacker who knows the password can decrypt the VPN's encryption for all users, exposing the content they are accessing. This significantly compromises user security and privacy.'

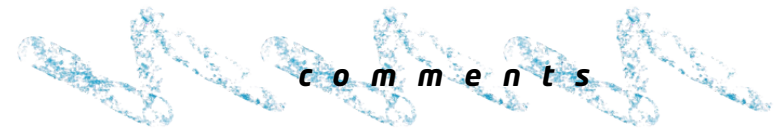

'Susceptibility to blind-in/on-path client/server-side attacks (client side confirmed, server side implied): An attacker can intercept and even modify communication without the knowledge of the user, a serious violation of their privacy and security.'

'using products such as TurboVPN, VPN Proxy Master and Snap VPN (supplied by the first cluster of providers), presents far more risk to user security and privacy than using a paid VPN app. This is because free commercial VPNs tend to capitalize on their users' data, potentially using ethically questionable practices in their development, marketing, and operations.'

I have no doubt that the free VPN providers are tracking their users and providing that access to people who want it or who are willing to pay for it. But this research does make me wonder who is actually behind the popular paid VPNs.

Clearly, VPNs are a honeypot.

240 sats \ 2 replies \ @DarthCoin 10 Oct

Run your own VPN through a random VPS.

For the noobs:

VPN = virtual private network

VPS = virtual private server

Rent a cheap VPS and setup a wireguard VPN tunnel.

Then connect whatever devices you want and also routers to it and browse through that VPN that only you can control it.

Bitcoin Core, Gold and Soft Forks
Watch on Youtube

Whatever happened to the once Strong, Proud,
and Brave Bitcoin Community?

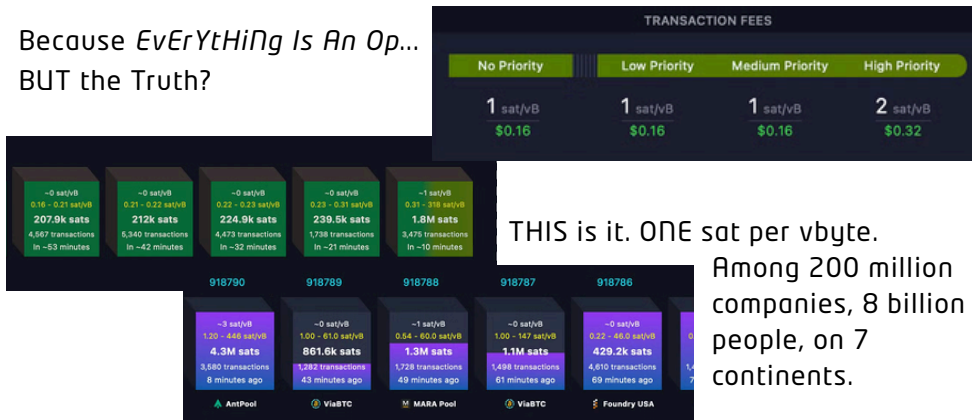

If "one" bad image (whatever that means) or one "classified document" (remember WikiLeaks???) gets into the chain (which was possible way before Core v30) then the entire chain has to be rolled back? Forked? Really?

Because of what Elizabeth Warren thinks?

Or CNN?

Certain 'influencers' and even people I once respected in Bitcoin can't wait to talk about the "attack vectors" and the "government operation" to "ruin Bitcoin" and so on and so forth...

Because *EvErYtHiNg Is An Op...*
BUT the Truth?

THIS is it. ONE sat per vbyte.

Among 200 million companies, 8 billion people, on 7 continents.

If the people fearmongering about the "corruption" and "evil" and "stupidity" of software developers [who work VERY hard]... spent 1% as much time ACTUALLY USING BITCOIN we wouldn't be having the "SPAM" problems. SPAM would be 99% IRRELEVANT.

OLD Bitcoiners sent money to Wikileaks.

They said

- F*** the Banks
- F*** the Fed
- F*** the Government
- Not your keys Not your coins

And now? WELL if CNN doesn't like Bitcoin then it EFFECTS THE PRICE AND WE CAN'T HAVE THAT

WHAT in the ACTUAL F***.

Is Bitcoin censorship resistant or not? Is it "freedom money" or not? And if it IS... then people will use it. They won't bitch and moan about a small amount of spam that has disappeared 99%... they will be too busy USING Bitcoin BECAUSE IT IS MONEY and "THE BEST"

Bitcoin Users use Bitcoin. They are too busy using it to care about much else.

To the contrary SOME "Bitcoin users" (more like LARPERs) think that "JPEGS will kill it" or "one image" in a permissionless database usable by ANYONE on the planet... means "it can't work."

Is it money for *FREEDOM*? Or money for *PUSSIES*?

The lack of heart, guts, and fee pressure from statist larpers isn't good and most of these people will get rekt following a technically-incoherent hard fork pushed by people who aren't who they say they are and have possibly ulterior motives.

A sad day for freedom and a sad day for Satoshi's creation.

The shift from Krater is alarming and has lost his viewership from me. He's gone from peaceful and educational to red eyes holding a pitch fork.

60 sats \ 0 replies \ @Scoresby 13 Oct

Is Bitcoin censorship resistant or not? Is it "freedom money" or not? And if it IS... then people will use it.

This makes a lot of sense to me. Censorship resistance is the only value proposition of Bitcoin. If it can't do that well, then it's not going to be worth very much.

It may also imply that if people don't want censorship resistance, Bitcoin won't be worth very much.

My Own Little Economic Node and Thoughts

1831 sats \ 22 comments \ @BeeRye
12 Oct bitcoin

I've been thinking lately about node running and specifically as it relates to mining. It's dawning on me that not just running a node is important, but getting your node 'off zero' economically is probably more important for robust resistance to various network attack vectors. There seem to be two ways your node can be economically relevant in the bitcoin ecosystem:

1. Your node broadcasts transactions. This could be a store, an exchange or some sort of service (mixing, for example) where you / others use your node to either broadcast transaction or verify receipt of transactions. Also, I'd say running a lightning node using your node as the background service counts too...but someone could be convince me no perhaps.
2. Your node mine's bitcoin (or tries to). This would mean you are constructing block templates using your own node, and miner(s) that are mining are sending any block solves via your node (if ever).

Now, I do run a lightning node against my bitcoin node. I use it for commerce, zapping, etc. I also am using JAM on earn mode to add mixing liquidity.

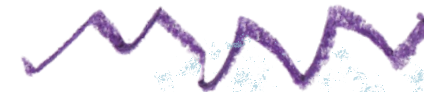

But, I've been thinking specifically about my node's economic relevance when it comes to mining. I currently run 4 machines: 2 bitaxes at about 1.5 TH/s, and 2 gen 2 futurebits at about 4 TH/s. I am running them all through DATUM using my own node, and have been doing so for about a year now. I am giving myself the goal of trying to outpace the difficulty increase in 12 month windows. So, looking back in the last 12 months, difficulty has gone from 95.67 T to 150.84 T. That is a 57.89% increase over that time frame.

So, in order for my little itty bitty economic node to outpace the network difficulty over the last 12 months, I need to increase my 5.5 TH/s by over 57.89%. That would be more than 9.5 TH/s. So, in order to do so I think I will get one of these avalon nano S (<https://altairtech.io/product/canaan-avalon-nano-3s/>) which would add 6 TH/s to my current fleet to put in my living room just as the cold season starts, which will increase my economic node mining by 109%, far outpacing the network's difficulty growth!

Mining is not just about the network power you retain via your little node, but it's also about the power you take away from all the other nodes. Many plebs in concert can take much power from Foundry / Antpool Mafia and make their lives / profits harder.

Anyways them's my thoughts

55 sats \ 1 reply \ @satgoob 12 Oct

I don't fully understand "off zero" - does that mean making it be above break even? The phrase sounds more like getting off a zero balance or something

↳ 0 sats \ 0 replies \ @BeeRye OP 12 Oct

im referring to getting off of zero economic activity in the btc node one is running (if they are running one).

65 sats \ 1 reply \ @OT 12 Oct

I like your setup!

I'm also doing something similar with my 3 nerdaxes. I'm solo mining through Datum though.

How is Jam going? I wouldn't think that you earn much through it.

↳ 50 sats \ 0 replies \ @BeeRye OP 12 Oct

Solo mining is just as economically relevant as long it's through the node, imo :)

JAM is hit or miss. It seems to be under constant DoS attacks or something because it can be months where it doesn't work. Lately (last month or so), it has been working and I've a few hundred sats. I set my mix amount quite low so I don't earn much, but the more liquidity the better for improving all user's privacy (and my own UTXOs).

"Your bitcoin conversion
was processed"

971 sats \ 6 comments \ @jasonb 16 Oct bitcoin

- > *A percentage of today's sales across all your locations has been converted into bitcoin. The bitcoin is now available in your Square bitcoin wallet. As always, you can modify your conversion rate or transfer bitcoin to another wallet at any time.*

Anybody following me knows that I'm overseas and doing a bunch of volunteer work. Meanwhile, I still currently have a fiat job back home and am collecting deposits for the holiday season. I've got a reoccurring client that always wants to pay via CC and I never let her because of the fees. This year, I took the bait because of Square's new bitcoin conversion thingy. I didn't even have a Square account before. Long story short: it worked! She's only paid the 20% deposit, and may do the rest some other way because I still jacked the rate to cover CC fees on my end. But still!

So, this week I: bought my first drugs with bitcoin; got paid in bitcoin for the first time; and created my first home assistant instance that made a bitcoin miner respond to a solar inverter. I'll post about the latter next week after some more testing. Not trying to pretend everything in my world is going great right now. Plenty of things are very hard and painful. I just wanted to share in case you're sitting there not seeing bitcoin adoption in your neck of the woods. Adoption is definitely happening in other places.

As you may know, this time of the year I am about to pause my construction project of my "citadel" and present you my latest updates of it.

I post it here first, on SN, before anywhere else, because I like SN for its long post format and also for the audience.

2025 - The 5th year of construction, the year when the 1st house is taking shape

In the previous parts of the story (Part 1, Part 2, Part 3) I've explained the motive of doing this construction and what is this "citadel". If you read this for the first time, I suggest to start with the previous parts.

Some readers of this journey sent me a lot of messages asking more details and/or trying to give me their advice or observations. Now I would like to add something more.

Considerations

- This post is not about me bragging! Is more like a walk-through guide for those that want to start a project like that. I just share my experience and Proof of Work with others that are interested in building their own place. You MUST be warned: a project like this is not easy as it looks! Do not think that is like in those engagement videos on Youtube showing you how to build a cabin in the Indonesian jungle or Alaskan forest. This post is about showing real hard work and be aware of it.
- This project would not be possible if before starting it I didn't stack sats hard and prepare my social and economical status. First of all I had to liberate myself from ANY fiat debt. You cannot accumulate sats properly if you are still in debt. And once you start living on Bitcoin Standard (earn and spend in sats) you must have a rule of "spend less than you earn" in order to be able to stay out of debt.

Debt = fiat mindset, slavery, somebody else is making the rules for you
Credit = bitcoin mindset, sovereignty, you are making your own rules

- This is an ONGOING project, is not finished yet and will not be finished more few years. This little house is just the 1st one from others that will be built on the premise, is part of a bigger homestead project. I had to build this house first, in order to have a proper comfortable place to stay, for me and other friends (if they come to help) instead of sleeping in a hammock or tent outside. Also this 1st house is like a "testing ground", learning and testing how to use local materials and procedures. I had ZERO knowledge about constructions and building a house. But I learned a lot from these 5 years (mostly summers).
- This place is far isolated from any road and villages, deep inside a mountains valley. The access to it is only by a narrow trail through a dense forest, alongside a river. So all materials, food and drinks are carried by myself, in a backpack, every week. There's no way to bring machinery, heavy tools and materials, so I have to use mostly what I have on site: wood, rocks, dirt... and my hands. Alone. Due to its location, I cannot work the whole year. Mostly between May and November. Being located into a high mountain valley, the rains and wind are quite heavy so I have to avoid them.

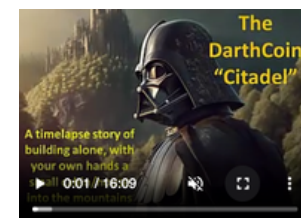

What I've done in the year of 2025

This year was very productive! And I could start early in May, with good weather all along and no other accidents happen.

As of today, my birthday 13 Oct, the house is not yet 100% finished but I could say it is 95% finished. I will still go few more weeks up until end of November, just to finish little things and carry some other materials and furniture. I just wanted to post this part 4 and also include a TLDR video time-lapse of the whole construction journey until now. So if you do not have the patience to read all the story, you can just watch the video below.

The video is quite long 16min but contain more pictures and it start from the beginning until today. Sorry for the low resolution, but on SN I could not upload files bigger than 50MB to be embedded. Maybe later when I will post it on my substack, will insert a better resolution video,.

Yes, it was really hard to reach this point, after 5 years ! And this year I could say that I've done the hardest work, not just of its increased effort but also because of complexity. Until now was just digging and putting earthbags as walls. But now was the time for the structure, the roof with its heavy beams, the resistance points, the heavy rocks wall. Each step was well calculated, not just for not making structure mistakes, but most importantly to not have any fatal accident. Remember I was working alone in a remote place, except few days when a friend helped me to carry and put in place the heavy logs for the beams.

You cannot imagine the effort I put this year !

Step 1: May - July 2025

So last year, described in Part 3 of this "Citadel" journey, I paused the work in October, with only few testing beams on top of the dormitory (the 1st half of the house), so this year in May I started with bringing proper beams and fix them in place.

Sometimes I had to use ingenious ways to carry them:

I wanted to use mostly fallen trees because they were dry and stronger than if I would cut myself a younger one. A green wood is not so good for construction, especially for beams. It will bend easily under pressure. Also I do not like to cut green trees.

Protecting the environment is part of living in nature, because without it, you are kind of fucked. So I was in continuous looking for dead fallen trees around the area; this happen quite often due to heavy winds and storms, high pines could fall and after few months are dried and easier to carry. A green log is much heavier than a dried log.

Do not think that is easy to carry such beams, like 400-600m through a dense forest or a big boulders path. Sometimes took me one entire day to move these heavy logs and put them up in their place.

Each log is like 4m long and with a 18-25cm diameter. I had to put strong beams because on top of them will come the "green roof" (1 level of gravel, 2 levels of dirt and on top flowers).

Between carrying the logs, in the evenings, I was also busy with covering the earthbag walls with a level of "beer-cans wall" and preparing the base for the 2 beds:

...And at mid July I also had already covered the roof with dirt and well protected.

Carrying all those rocks and dirt with a 40L bucket (like 20-30kg), over 60 times, that is like almost 2 tons of material. I used the dirt and the small rocks dug out from the hill. That was a lot of work and effort.

Step 2: August - September 2025

Now with a proper roof in place (only on the 1st half of the house - the dormitory) I can start working on the 2nd half of the house: the "living room".

I started to dig the remained south wall, where some big rocks had to be taken out and build and additional pylon for the beams. This wall

wasn't built entirely with earthbags because it will contain also 2 big windows, looking towards South and having a lot of sunlight all day. Also will have a nice sofa (build from earthbags) and could sit and look outside the windows.

On the outside, the earthbags wall was covered with a small rocks wall to protect them from sunlight....

Step 3: October - November 2025

This month remains to finish the chimney wall and the entrance wall. Now that the roof is ready and strong for the both parts of the house, is a quite a nice place to sleep, eat and spend some time. But I have to hurry to start building the entrance wall and be prepared for the winter. Here the winter can come really fast after October, with heavy rains and winds and even sometimes snow.

Main tasks:

- finishing the chimney
- finishing the exterior level of "soft wall" with rocks
- adding the interior level of the rocks wall
- starting the entrance wall with the big boulders

get the rest of the story here:
