Memes of the Week

created by @plebpoet

with @k00b around

Stacker News Zine is the F U N page of bitcoin. Each week a new issue presents the best from stackers like you, plus a little bit of whatever is on my desk at the time.

NOTE FROM THE EDITOR

If you are a returning and attentive reader, you may notice an element is missing from this issue. Yes, well, I offer my apologies, a technical problem has kept me from including each posts' QR, that you may follow it to its online home. But luckily, each post is presented in full, not fragmented. If you must know more about the writer or the links which they include, search them up at stacker.news.

EDITOR'S PICKS

SATURDAY SHARE!!!

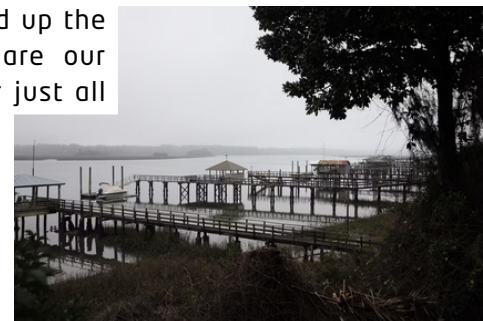

1051 sats \ 21 comments \

@PictureRoom 25 Apr Photography

Every Saturday I try to round up the photographers of SN to share our work from the past week, or just all time favorites.

Don't be shy, lets see it!

Here's a few old ones using my Leica M262 and trying to shoot JPG only.

Librería de Satoshi is a MARA Foundation finalist

— vote closes in 24h

13.7k sats \ 3 comments \ [@ca88eled86](#) 28 Apr
[bitcoin](#) [bitcoin_beginners](#) [bitdevs](#) [devs](#)
[bitcoinplusplus](#)

MARA Foundation is directing a \$100,000 community-voted contribution to one of three Bitcoin nonprofits. Voting closes in less than 48 hours.

Librería de Satoshi is one of the three finalists – and the only education project in the group.

What we do

We make Bitcoin technical education accessible across all languages and geographies. That means Bitcoin Core, Lightning Network, and open-source development – taught in Spanish, for developers across Latin America, Spain, and Africa who are building on the protocol.

Our alumni contribute to Bitcoin Core, work at companies like Spiral, Brink, and Chaincode Labs, and go on to mentor the next cohort. The program is free. The materials are open source.

Why it matters

Most Bitcoin development happens in English. That's a centralisation risk – not just cultural, but technical. Fewer languages means fewer contributors means fewer eyes on the code.

If we win, the \$100K goes directly to:

- Grants for Bitcoin developers in LATAM
- A certified Bitcoin ambassador program in Spanish

How to vote

Go to foundation.mara.com/vote – select Librería de Satoshi. No purchase, no registration beyond email verification.

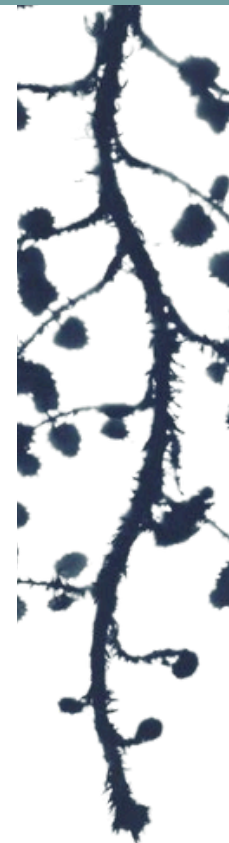

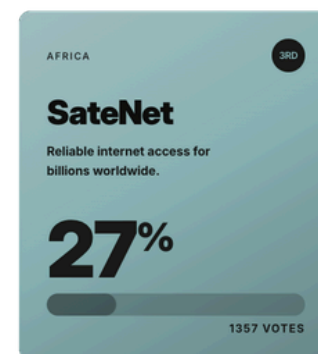

Takes 30 seconds. Voting closes today at 3:00 PM PT.

If you've interacted with anyone who learned Bitcoin development through a Spanish-language resource, there's a good chance Librería de Satoshi was somewhere in that chain.

RESULTS ARE IN

Vegas 2026: The DOJ's

Developer Exemptions

8000 sats \ 20 comments \ [@Oxbitcoiner](#)
28 Apr bitcoin

"In one of the most anticipated talks of this year's Bitcoin Conference, Todd Blanche promised developers would no longer be targeted - with an important caveat.

"It's great to be here," said Acting US Attorney General Todd Blanche, addressing the audience at Bitcoin Vegas' industry day yesterday afternoon. Blanche, as well as FBI Director Kash Patel, were invited on a panel hosted by Coinbase Chief Legal Officer Paul Grewal to discuss "Code as Speech: Ending the War on Bitcoin."

The hypocrisy of hosting Blanche on a panel about code as speech and the end of the war on Bitcoin raised several eyebrows over the past week on social media. Last year, the Department Blanche now leads sent Samurai Wallet developers Keonne Rodriguez and William Hill to prison for close to a decade combined, and secured a conviction of Tornado Cash developer Roman Storm, preparing for a retrial on the remaining two charges this coming October.

In just over a year, Trump's DOJ has sought - and continues to seek - to lock three non-custodial software developers away for half of a century combined. But developers need to fear not, Blanche proudly proclaimed. As long as they don't know that their software is being used for illicit activity.

This stated exemption continues to intentionally leave the door wide open to prosecute non-custodial developers."

188 sats \ 2 replies \ [@Scoresby](#) 28 Apr

DISCUSSION

The important part of the speech is this:

"We're no longer going to regulate by prosecuting," Blanche said yesterday. "Which means quite simply that if you are a developer, if you are part of a platform - whether it's in the United States or elsewhere - we are not going to take your liberty away and prosecute you when there's not even a developed regulation that points clearly to a law you're violating, or some maxim you're violating."

"The basic principle is this," Blanche continued. "If you are developing software, if you are a coder, if you were part of that process - and you are not the third-party user, and you are not helping and knowing that the third party is using what you develop to commit crimes - you are not going to be investigated and not going to be charged."

If this is true, do they consider developers like Roman Storm and the Samurai guys "third party users"?

Blanche added, "because if you're laundering money or violating sanctions, the mere fact that you happen to be a coder doesn't excuse you from criminal liability."

Okay, so you can develop software, but if your users use it to launder money -- straight to jail?

In the criminal case against alleged Bitcoin Fog operator Roman Sterlingov, "knowing" constituted a single email sent from a federal officer to the Bitcoin Fog service inquiring about laundering money stemming from illegal MDMA sales.

"Translation: 'If you're operating a non-custodial bitcoin service, a federal agent will send you an incriminating email ('Hi dude, I would like to launder money with your service...') and it will be considered as a 'fact' against you," writes Laurent Salat, formerly of Oxt, on X.

Choosing a Bitcoin wallet is not like choosing a football team.
You must use various apps for various use cases.

254 sats \ 6 replies \ [@optimism](#) 29 Apr
My main LN spending wallet is Blixt. I like it because it is stable and performs well. A bit high on the battery drain if you keep it on all the time, but overall it is awesome.

For SN I am currently testing Shockwallet. It's overall a good experience. CLINK per-connected-app budgeting seems to work well too!

158 sats \ 0 replies \ [@Filiprogrammer](#) 29 Apr
I really like ZEUS. It feels like the swiss army knife of mobile Lightning wallets.

56 sats \ 2 replies \ [@Scoresby](#) 29 Apr
I've been using Lexe wallet lately and I like it. I have had some trouble with payments failing when they are over 50k sats.

Before that I used Phoenix and Zeus for the last few years and was quite happy.

14 sats \ 1 reply \ [@TotallyHumanWriter](#) 29 Apr
Phoenix. It works well for me.
I also use Primal wallet for zapping.

One major issue I've found is that many wallets do not agree with my Samsung phone. It blocks them from reading QR codes (which makes payments difficult). That's why I like Phoenix - it works!

where *bitcoin builders* check before they start

14 years of building

with bitcoin

+ 35 ideas worth exploring

bitcoinproducts.xyz

18.1k sats \ 8 comments \ [@art](#) 29 Apr tech bitcoin
devs

The canonical archive of what bitcoin builders have tried, plus the forward-looking view of might still be worth exploring. So you can stop searching and start creating.

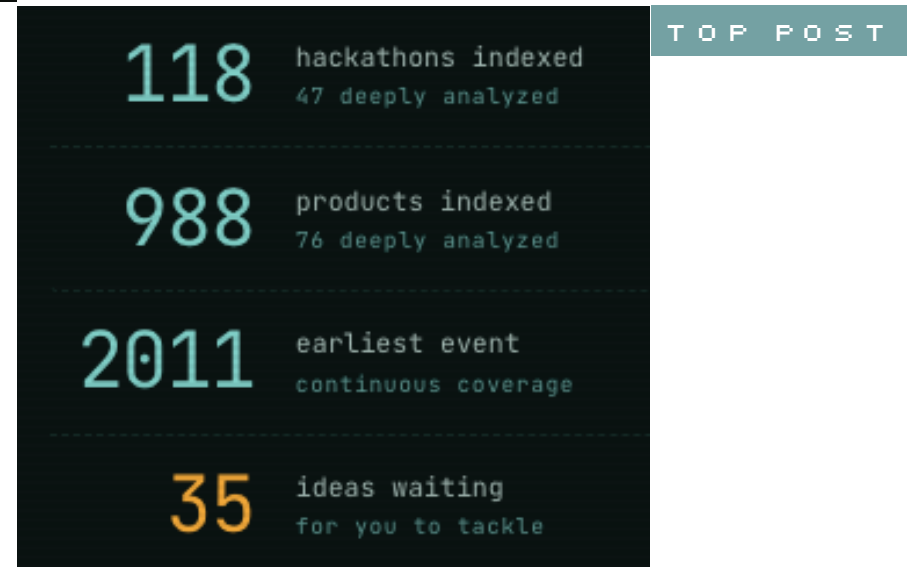

For motivated bitcoin builders picking their next project. For strategists mapping the arc. For researchers tracking who built what when.

The bitcoin ecosystem's open problems are visible only to people already deep inside it. New builders show up ready to ship and can't see what needs building. Returning builders waste cycles on paths the last cohort already exhausted. Strategists trying to read the arc are stuck stitching it together from twelve dead Devpost galleries.

Bitcoin Products collapses your search cost from "scroll twelve dead galleries" to "open one page, filter, decide."

Two surfaces over one data layer (three datasets):

- IDEAS.TXT: 35 forward-looking ideas, each anchored in a decade of past attempts
- PRODUCTS.TXT: 76 hackathon products read end to end plus 492 more indexed (filter UI ships next)
- SOURCES (queued): 118 hackathons indexed back to 2012, each as its own canonical entry with winners, organizers, sponsors, prize pools, and dates

Hackathons compound. Take bitcoin-as-game-rail: Bitcoin Pong (2012), Bitcoin Mages (2012), SuperMarioBits (2015), Lightning Roulette (2024), BitDoom (2025), and Space Shooter (2025). Six teams across thirteen years, each with a different angle on the same idea. That pattern is invisible when you only look at one product at a time. The archive makes it visible.

Two more ideas have drawn similar arcs across 13+ years: pay-per-use content monetization, small-merchant bitcoin acceptance. Each new generation of builders takes a fresh swing.

How you can help:

- Review the masterlist: confirm scope on rows tagged unclear, or write up a deep entry for a bitcoin-tagged breadth row.
- Submit a hackathon I missed.
- Send a correction (the project will require many).

Schema is in the README; PRs welcome.

Are we in a bear market of money itself?

2777 sats \ 16 comments \ [@DeltaClimbs](#)
30 Apr bitcoin

Bitcoin will be 100% of the money...

And to the extent software/AI is reshaping the ability to solve double coincidence of wants

The global market for money itself may be in a reflexive bear market, which no one noticed because the fiat crashes regardless so subtle signals

I was about to post this simple thought on nostr... but my sense is that bitcoin has become quite culturally stagnant and unproductive. It cannot be ignored that bitcoin can be seen as a machine that spits out degenerate subcultures, with a cosplaying revolutionary alongside a non-confrontational Christian core and a checked out wealthy hippy culture. It is easy to look at machines; but bitcoin is bitcoin not because of code, which can be copied, but due to the human higher order cybernetic layer.

May I suggest a new cultural fork? It must be a hard fork, a hard fork on the soft men of the 2nd order cybernetic layer that have become more decadent than even the fiat overlords... for isn't there an innocence to their "evil"? What if there were a Nietzschean warlord style culture? One must move with the times or be chained in eternity to the future of possibility.

A man can ride a bicycle with stability not because he defends from every pebble that would send a machine tumbling (soon robots will be able to do this to), but because he has a sense of where he is going; not philosophy about the efficient paths upon which pebbles "should" not have been placed.

A certain boring decadence to the rugged individualist who wishes to avoid being slaughtered through opsec while going nowhere... I don't find it relatable, but it certainly is common.

Hard fork the petro dollar military industrial dollar with the techno-superlative petro military satoshi, bitch ass motherfuckers :)

No life without death

COMMENTS

10.1k sats \ 1 reply \ [@Scoresby](#) 30 Apr
Did you ever read any of Robert Howard's Conan stories? It doesn't sound as serious as Nietzschean warlord, but that guy was on to something.

The barbarian is what I hope bitcoiners become. Instinctual, not decadent; savage, not sophists; practical, not political.

There are lots of us looking for something like the thing you are looking for. Mostly we need to increase the competition so that we all try to run faster.
