Steak 'n Shake: First Time

3783 sats \ 26 comments \ @billytheked

20 Jul the_stacker_muse bitcoin

Welcome to Steak 'n Shake

A capped twenty-something greeting. Scraggly beard, ginger. A kind look under the brim of his hat. A smile.

White checkered tiles, the smell of beef pattys, some wildfire smoke rolling in behind me. Grumbling.

Honey, what do you want?

Follows his gaze to a kiosk. Enter your first name TAPTAPTAPTAP

Is this even the right place? Scans the kiosk.

TAPTAP TAP

CASH, CREDIT, DEBIT, BITCOIN

Oh, thank high almighty, the rumours are true. Ok, turn on roaming data?

No, wifi.

STEAK N SHAKE GUEST

Brilliant.

Zeus....Lightning,,,,,,send.....open QR reader....

HONEY?!

A burger. No--*A double steak burger with cheese* burger. Oh, Tallow Fries?

Don't mind if I do. +1 Large. Medium soda, can't be having to use the WC on the way home. Where are we again? What year? Siggys got a \$ branded into his bun...

TAPTAP

What? Who is Siggys?

Never mind. Sauce? Uhm. Chipotle Checkout, Choose payment method...

CASH....DEBIT....CREDIT....BITCOIN(!!!!)

Bingo. Swats at her hand. Taps BITCOIN

Zeus again. Scan QR.....Send payment.

....

Ha-ha-HALLELUJAH!

Woaaaaahhh

A look of astonishment. Did that really just happen? Is it still the year twenty-twenty.....?...

My Local Bar is Closing: On Schelling Points and the Decline of Third Spaces

24k sats \ 20 comments \ @ihatevake

18 Jul the_stack_muse

Last year, at TABconf, Car & Keyan asked me what I do all day. With total honesty, I told them I spend much of my time hanging out a bar near me. For some reason, they found this amusing, like I'm wasting my life drowning in drinks.

Well, that problem won't plague me much longer, because the bar is on its last legs. I found out recently that the owner "Craig" is two months behind on paying the landlord, and the doors will likely be locked this coming Monday.

It's the end of an era.

The Bar

I initially started hanging out at the bar in mid-2023, a few months after its opening. The reasons were primarily out of convenience; it was near home, had comfortable furniture to lounge (sofas and cushioned chairs) and do work (upright seating), large windows allowing the sun to shine through, and great wifi that made it convenient to work away from home. As I spent more and more time there, I got to know the staff and roughly three dozen other regulars that used it as a pseudo workplace and home away from home. If you wanted to see "the crew," that was the default place you'd go. For close to three years, if I wasn't at home or the gym, the bar was the most likely place you'd find me and many others.

The glue of the bar was "Colby." The founding manager, he designed and built the space for Craig (who lives >100 miles away and I've seen maybe twice), running operations, finance, deliveries, hiring and maintenance. Although the staff had turnover, as is typical for any kind of service establishment, Colby and a handful of long-serving bartenders were consistent faces. Everything ran like clockwork, until ~6 months ago, when Colby finally moved on to a higher paying job opportunity. The glue was gone, so to speak, and it seemed like operations slowly began to fall apart without an experienced manager in charge. Staff would mention that they were late in getting their paychecks, certain drinks would be out of stock, and so on. Several other members of the team headed for the exits and regular customers started fading away. I knew the place was hanging on, but I didn't know the severity of the situation until one of the last remaining long-serving bartenders showed me the late rent statement, along with threat of legal action, two days ago.

Schelling Points and Third Spaces

Discussing the situation the other night, someone suggested we all start hanging out at a similar bar about 5 minutes away. I immediately knew this wouldn't work because of the difficult shifting the [Schelling Point](#) (a term bitcoiners might be familiar with). The value of the bar isn't purely drinks and decor, it's the knowledge that, if I show up at this place, there's likely 10-15 people I know hanging out there. The conversation, familiar faces, spontaneous interactions cannot be easily replicated at a new location. Everyone is making the same rough calculation, "I'll go there because everyone else will probably go." Now that the bar is closing, while some might choose hangout spot A, others will switch to B or C or D. There's no effective coordination mechanism to get everyone to choose the same option. Just like money or languages or communication protocols, hangout spots have something of a network effect to them.

In popular discourse, there has been much lamenting about the [decline of third spaces](#). Many reasons have been given for this- rising rent costs, economic stress, social isolation- but I think one of the understated factors is that we all have phases of our lives, and periodically move onto the next thing. We move for school, for jobs, for relationships. Few live in their hometowns well into adulthood. Every aspect of life is more transient. The hometown pub that you and your friends hung out at from youth well into old age doesn't really exist anymore.

I don't know if I'll go look for a new bar. Maybe I'll take this opportunity to travel further and sample many different locations, instead of being loyal to one spot (although you don't get the benefits of community, in this case). Or maybe I'll be more productive and get work done at home, without the distractions of laughter and friendship. Only time will tell.

BTC vote: Do you support the Senate version of the CLARITY Act?

13.4k sats \ 10 comments \ @KoinVote

20 Jul bitcoin Politics_And_Law -24k sats

A new bitcoin vote is live.

Do you support the Senate version of the CLARITY Act?

A revised Senate version of the Digital Asset Market Clarity Act is awaiting consideration by the full Senate. Compared with the House-passed version, it includes several notable changes, including expanded restrictions on interest-like stablecoin rewards, new compliance requirements for regulated firms using DeFi, and the removal of the House's anti-CBDC provisions.

Options:

- Support
- Oppose

Total reward: 100,000 sats

Update: We have doubled the number of winning addresses allowed per BTC and lowered the minimum payout threshold by 40%, giving smaller addresses a better chance of receiving a reward.

The core principle remains unchanged: addresses holding more Bitcoin still have a higher chance of winning and are expected to receive a larger share of the prize pool. This adjustment simply makes the actual reward distribution more closely reflect that principle.

Subscribe to reward event notifications.

No signup. No deposit. No wallet connection.

Just sign a Bitcoin message with your address and submit.

Rewards are distributed based on address balances, regardless of which option you choose. Higher balance = larger share.

Your Bitcoin never leaves your wallet.

A public payout report will be published and can be independently verified.

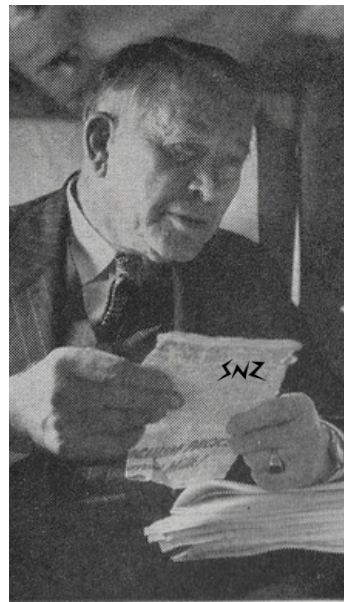

Submit your reply and earn some sats!

Have you ever looked up the onchain history of bitcoins you received?

3560 sats \ 12 comments \ @Scoresby

22 Jul bitcoin AskSN

Even though there aren't a ton of tools for looking back at the history of coins you may receive, you can do some amount of sleuthing just using something like mempool.space (I don't recommend doing this unless you take some privacy precautions like using tor -- it's probably best to host your own instance connected to your own node if you want to be looking up utxos connected to your personal stack).

But I think there have only been one or two times where I tried to trace the history of a utxo I received -- and I didn't feel like I learned very much useful info.

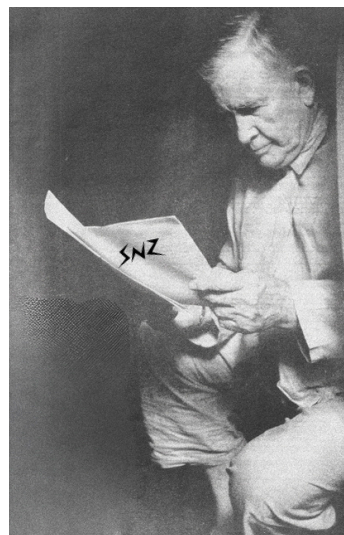

Have you ever tried this?

comments

223 sats \ 0 replies \ @OT 22 Jul
I have done in the past.

It's interesting to look at and guess who may have had it before. I tried once to go back to its initial coinbase TX but it was taking too long.

118 sats \ 2 replies \ @Fenix 22 Jul
to be honest when I tried to follow the path, when I started in bitcoin, I realized that is interesting at the same time that is boring. it's cool see how the utxo are break or consolidate into another ones, but without faces just transactions with no faces, we can't know the history, just presume (specially when it has no "financial information")

Wasabi Wallet is unstoppable

32.7k sats \ 30 comments \ @lontivero
22 Jul bitcoin

We are proud to announce that Wasabi Wallet v2.8.1 is out. It sets a major milestone which took more than a year to achieve: to make Wasabi unstoppable.

Yes, **Wasabi Wallet is unstoppable** now. This is the result not only of a long, complete redesign but, even more important, of a lesson learnt from the Samurai failure. One day we all woke up with the news about the Samurai case, and what shocked me the most, apart from the human perspective, was witnessing how an open source software project can die. I remember reading users requesting support because their wallet showed them a 0 btc balance, the fear, the ignorance reigning in most of them about what that 0 meant – something I don't want Wasabi users to ever go through.

The latest version can not only work with nothing more than your own node but can also work with just the Bitcoin P2P network. Coordinators form a long chain of fallbacks, releases are distributed automatically thanks to Nostr, and even if GitHub cancels our subscription and blocks the project repo, nothing happens because Wasabi can find the releases wherever we put them.

We could enumerate features – there are lots of them – but **unstoppability** is the one that we would like to highlight today.

To the loyal Wasabi users, all our gratitude for your support and we hope you find this work valuable.

2022 sats \ 0 replies \ @ihatevake 23 Jul

You guys have done an excellent job and deserve a huge amount of credit. Honestly, I think the project is in a better state now than during the ZK Snacks era.

And for anyone looking to support Wasabi, there's a Silent Payments donation button baked into the wallet (which you can confirm against their socials).

442 sats \ 9 replies \ @tomlaies 23 Jul

This sounds like something solved DECADES ago via bittorrent. Not sure why we're trying to reinvent the wheel here every time.

2022 sats \ 7 replies \ @lontivero OP 23 Jul

It is not a reinvention, the distribution mechanism contemplates the possibility of using bittorrent, the difference is that the wallet detects there is a new version because it is published in nostr and it can inform the user. In case the protocol used is http, it can also download it and verify the authenticity automatically.

126 sats \ 1 reply \ @ek 22 Jul

> releases are distributed automatically [...] Wasabi can find the releases wherever we put them.

Do you mean automatic updates? I'm not sure that's a good thing.

351 sats \ 0 replies \ @lontivero OP 22 Jul

No. Automatic updates is evil. I said automatic distribution, which means that Wasabi can find new releases, download them and verify them for you.

It doesn't update/install anything. It just tells you: there is a new version downloaded here. So you can install it or ignore it.

Woocommerce and BTCpay server

15.4k sats \ 61 comments \ @Natalia
23 Jul bitcoin

I've been using a hosted BTCpay with woocommerce to accept LN for a few years now, integrated with Blink wallet, which is working really well, but I don't know how things would work when Blink changes to non-custodial, since the new account created now doesn't even have API access, not to mention that Blink also got a light KYC.

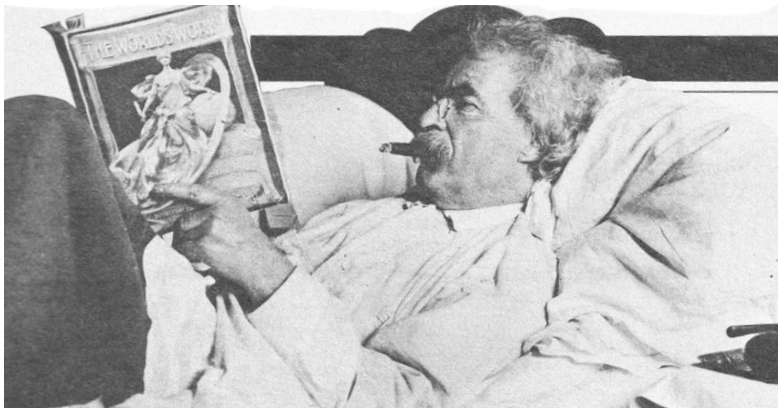

Or I could use Rizful as backend to accept LN, but the hosted BTCpay that I'm currently using doesn't support it.

So it seems here are the options:

1. Running the BTCpay server myself, lunanode might be the choice, but I remember it had light KYC a few years back when I tried it.
2. Finding/paying for the hosted BTCpay which enabled the PWC plugin so that I could use Rizful - any good recommendations?
3. Running both the node and the BTCpay server myself, I would really like this, but since not many people are paying in Bitcoin yet, probably it's better to opt for the more cost-effective option at the moment.

Or does anyone know a better setup?

@AG

460 sats \ 19 replies \ @Scoresby 23 Jul

@pretyflaco did this video for blink+btcpay server about using the blink plugin with their new non custodial wallets.

He says that the plugin is updated to support the non custodial options.

124 sats \ 15 replies \ @Natalia OP 23 Jul

Many thanks! So I guess things could stay unchanged: WooCommerce + BTCpay server + Blink. Another thing that annoys me is that it's harder to pass Blink's verification with a burner number now. Has anyone found new tricks? (I don't know should I even ask this in public 🐱)

351 sats \ 7 replies \ @DarthCoin 23 Jul

With the new Spark Blink you can connect a BTCpay. You have instructions right into the app. You have to do the migration.

The bad thing is that Blink now uses Spark soooo:

- you will pay swap fees for EACH payment
- you will NOT use bitcoin, but a sidechain crap
- any payment will have possible issues due to the swaps.

You have been warned. Is time to ditch all these crap things, especially boycott the fucking spark.

233 sats \ 2 replies \ @supratic 24 Jul

I read you are using woocommerce. My simplest suggestion in this case is:

- keep woocommerce
- create/signin with shockwallet.app
- join bootstrap mode (honest fees, or run your lightning.pub for zero fees)
- install woo-clink (demo here)
- connect shockwallet with woo-clink with a noffer

That's it! You are sorted, and you can also charge sats in auto-renewal for subscriptions. You also gain privacy, as there are no HTTP/HTTPS calls for the lightning payments. Everything goes through Nostr relays.

Unexpected Orange Pilling Success

24 Jul bitcoin

Close friends are our house guests for a few days. The husband is an old college buddy who is battling serious health issues. They are both around retirement age, but still working.

We were sitting around after dinner last night when my wife says something along the lines of "Siggy is a complete bitcoin nut." She says this often in social situations, but it rarely spurs any conversation. My friend's wife said "what the hell is bitcoin, anyway?", and everyone turned to look at me. Even though I have been obsessed for more than 8 years now, I always struggle with this simple question. I blurted out some stuff about internet money, double spending, inflation proof, etc. I second guessed every word that came out of my mouth. None of it mattered anyway. They wanted to know how much a bitcoin cost when I first bought it, and how much it was worth now. They liked the answer. The wife wanted to know if it was hard to buy bitcoin. I mentioned cash app, and she said she uses it but didn't know you could buy bitcoin. I explained that it was easy to start buying on the app, but then I talked about NYK NYC and hardware wallets. They both were very interested, which surprised me.

This morning they asked if I could help them make their first purchase on cash app. First my friend's wife bought some, then my friend downloaded the app.

They had many more questions, so I suggested they read Lyn Alden's book Broken Money.

So far, so good. They will be staying with us through Monday, so I'll post any significant updates.

The lesson I learned from all this?
Never underestimate NGU.

Do you run a small business and manage the money yourself?

50k sats for 20 mins

3084 sats \ 11 comments \ @stackingharder

24 Jul AGORA

Hey! I'm researching how founders, consultants and solopreneurs manage the financial side of running a business.

I'm looking to speak with people who personally keep track of things like:

- whether customer payments have arrived
- invoices that need chasing
- upcoming bills and payroll
- cash spread across different accounts and wallets
- what financially needs attention today

I'm especially interested in how you currently piece this together across wallets, banks, Stripe, invoices, email, accounting software and spreadsheets, and what work you would trust an AI agent to prepare or handle for you.

This is a 20-minute research conversation, not a sales call. No preparation required.

I'm offering 50,000 sats as a thank-you.

If this sounds like you, reply here or DM me with a sentence or two about your business and how you currently manage its finances.

The research is for an early-stage product I'm exploring around helping founders and independent professionals better understand what is happening across their business finances. I'm trying to understand how people currently track money coming in, upcoming obligations, overdue invoices, cash across accounts, and the financial tasks that require their attention, that type of thing. I'm also exploring which parts of that work people would be comfortable having AI prepare or automate. The interviews will be used to identify recurring problems, workarounds they use and potential product requirements. I don't require anyones name, financial data, or anything like that. The research is just for me, and isn't being sold to a third party.
