🍕 Happy Bitcoin Pizza Day!

59 sats \ 5 comments \ @supratic 22 May bitcoin #986416

On May 18th 2010 Laszlo Hanyecz made known on a forum at bitcointalk.org that he was willing to buy 2 pizzas for a price of 10,000 Bitcoins. At the time this was worth \$41. Four days later on May 22nd the transaction took place. Forum member Jeremy Sturdivant from California took him up on the deal and had two Papa John's pizzas delivered to Laszlo in Florida. This date has become known as Bitcoin Pizza Day.

Note from the Editor

Each week that I have put together a zine, the total now is 10, I have aligned its content according to a theme. You may notice this week, I am without a theme. And that's the story! Hope you enjoy.

Quick background

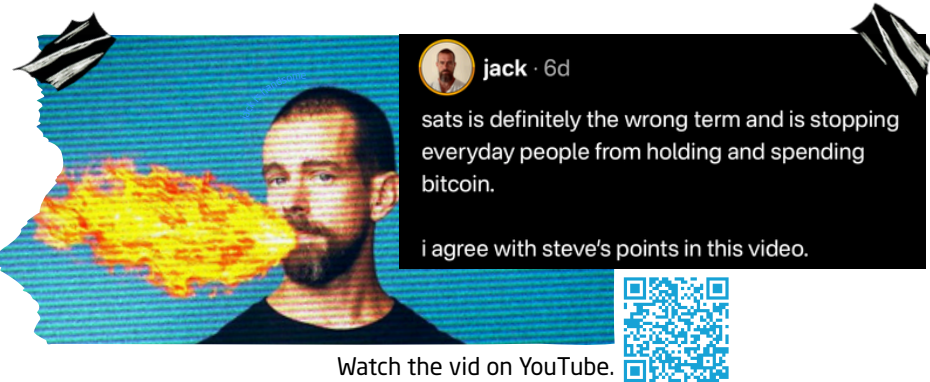

In December 2024 John Carvalho proposed BIP 21Q titled "Redefinition of the Bitcoin Unit to the Base Denomination." His point: the word "bitcoin" should not refer to the 21 million bitcoins we hear about, but to what we currently call "sats", the "base" unit of bitcoin. There are 2.1 quadrillion sats. So, instead of saying there are 21 million bitcoin, BIP 21Q suggests saying there are 2.1 quadrillion.

There'd be absolutely zero change to Bitcoin, the protocol, with this BIP (unlike the OP_CAT or more current OP_RETURN debates). This is just a movement to get people to change the way they talk about and refer to "bitcoin." BIP 21Q is just a rewording, a rephrasing, a rebranding, a rethinking.

Since

Since then, there has been discussion. I'll admit it's interesting to talk about, but I've never thought much of it. My take has been, and frankly still is: this too will pass. I hadn't heard or thought of this in a couple of months. Until...

In the past couple of days though, like a campfire that has been slowly dying down, a sudden rush of wind has fanned the embers and the flames have sparked upward. As best I can tell, that wind came out of the mouth (or typing) of Jack Dorsey (Twitter founder, Square/Block CEO, billionaire, you know Jack) when he put this note out.

Watch the vid on YouTube.

The video makes some good points, both against and in favor of BIP 21Q.

...

Today, I even read chatter about a middle ground compromise to use "bits" as the base unit. In other words, don't use "sats" but use "bits." I guess the idea is that a bitcoin can stay one of 21 million, but "bits," which sounds like little bitcoins, can be the 2.1 quadrillion. "Oh brother," I thought, even more confusion. We've been through this back in the 20-teens with bits, ubits, and mbits. This was a main reason I made the Satoshi Bitcoin Converter because it was confusing! I'm happy we were past all this, but then...it's back!

Just for kicks, you can fool around with the old SBC version 7 and find out how confusing it is.

Enter a number.

	฿ BTC-bitcoin
	mBTC-millibits/mbits
	µBTC-microbits/bits
	シ satoshi
	≈ USD at pageload

One of the arguments in the video is that the BoardwalkCash.com folks have adopted "bitcoin" as their base unit. Boardwalk Cash is a cashu/ecash (and Lightning) web app with the intention of making spending and receiving small, coffee-sized payments easy.

Notice the bitcoin B after the zero, not "sats" or a satoshi symbol, like the one I proposed: シ 😊

I sent 21 sats (bitcoins?) from a different ecash/cashu wallet. And, boom, there they appear in Boardwalk Cash. Notice how it appears as 21฿, as 21 bitcoin. Then, when I click it, it shows \$0.02 USD, two pennies.

21	฿ BTC - Bitcoin
2,100,000.00	シ sats
2,162,557.74	≈ \$ USD

I didn't actually send 21 what-we-think-of-today bitcoins, worth \$2.16 million. I sent two US pennies worth.

And so...

And so, this is the main argument against, in my view: possible confusion. The other issue would be the changeover by things like exchanges or maybe even smart contracts that bridge BTC to other chains. Having worked on my little converter app, I know that it can be easy to make a decimal mistake in the code and throw everything off. I'm certain that, should we move to 2.1 quadrillion bitcoins, somebody will foul up an interface or back end which might cause a big problem, maybe some big losses.

Two things here:

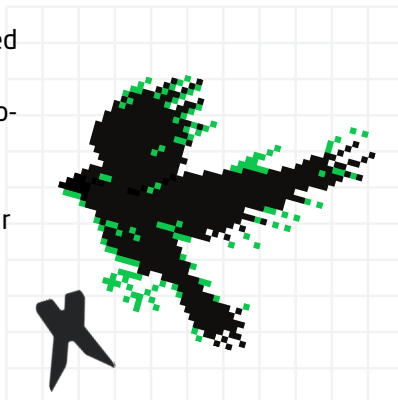

On the more technical side, the changing of names and code on exchanges or smart contracts, it would almost be better if there was a hard-and-fast, set changeover date, like there was with Y2K. There is a clear before-and-after, B.C. and A.D. date. Call it, "BQ" and "AQ", before and after quadrillion. 😂 If there was a date/time where everything was 21M "bitcoin" to 2.1Q "bitcoin", that would force the issue.

However, there is not such a date or time, nor will there be...recall that bitcoin is decentralized, no CEO here. If this 2.1Q change actually happens, the reality is that it will be a rolling, gradual, thing. It will be case by case, app by app, exchange by exchange. And some won't make the change at all. This lends back to the confusion situation.

Secondly, on the human perception side, this actually concerns me less. We can change human perception. It takes some time, but human perception and thinking is very plastic and can definitely be molded. Heaven knows the examples of how this has been used the wrong way in history, umm, anything like this go on in World War II?

...

More recently, we all know that Twitter rebranded to X. It seemed so dumb, definitely awkward, I'm still not entirely used to it, people still write, "...so-and-so posted on X, formerly Twitter,..." (as if no one knows that X is formerly Twitter), I still say people "tweet" on X, but it's changing. I now hear reference to what so-and-so said "on X", with no mention of Twitter. It's changing. Time...it'll change...Twitter will stop being mentioned, Twitter will be a part of history, like Esso.

**What'll happen with 21Q?**

Nothing. I fully predict that this 2.1 quadrillion bitcoins thing will go nowhere. One of the main reasons for moving to replace "sats" as "bitcoins" is the perception that 1 bitcoin is unattainable and that people know "bitcoin," but don't know "sats." A bull bitcoin is out of reach for most people, but sats are attainable by everyone with a wallet. And, if they don't know the term "sats," it's probably easier to change that perception (to educate them on sats) than it is to change and possibly confuse their knowledge of 21M bitcoins with 2.1Q bitcoins. It's probably easier to educate on "sats" than it is to change all the backends on exchanges and smart contracts and front ends (and some won't change at all, which will add more to confusion).

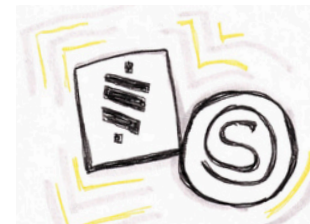

Solution: educate

Practical solution: if you think you might be speaking to a "normie" audience, make it a point to use the phrase "bitcoin sats." Over time, as people acquire and use sats to buy burgers, they'll know that sats means 1 of 2.1 quadrillion, but a bitcoin is 1 of 21 million. This is the Esso tiger lowering "bitcoin" and raising "sats."

Bitcoin 0.00000200 SATs

Best interface design I ever saw for a Bitcoin wallet. How much are you sending? Some tiny amount of Bitcoin that comes out to 200 SATs. This is our esso tiger.

292 sats \ 2 replies \ @LibreHans 17 May

This is never going to happen, and there's no need for it. There's 16 years of history we can't simply undo. People who can't understand bitcoin vs sats simply refuse to learn anything about bitcoin. Changing units won't change that.

31 sats \ 0 replies \ @Taurus 17 May

I've been sending sats since 2020, Lightning network debuts. All the youngs I have talked to and introduced Bitcoin love the term. Small unit for Bitcoin (still Bitcoin but like cents it's really useful to have a smaller denominator for day to day payments, like every other form of payments in fact)

30 sats \ 0 replies \ @k00b 17 May

I suggest we just drop the term bitcoin all together and call it the Satoshi network.

Get Yourself To A Bitcoin Meet Up Soon

2023 sats \ 32 comments \ @siggy47 19 May bitcoin #983643

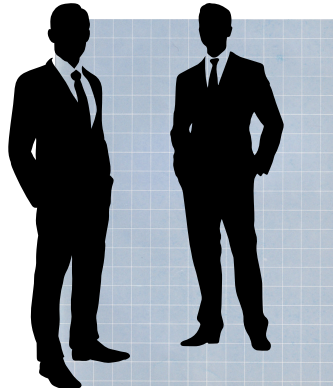

I went to my local meet up a few nights ago. I am part of a small group of regulars who meet monthly over the past few years. Comraderie is quick to develop when you share a rabid interest in all things bitcoin. I always look forward to hanging out with this group.

The latest gathering was well attended. There were many new local people showing an interest in bitcoin, and the regulars were as excited as ever to chat.

I met two businessmen who are making their way down the rabbit hole. They both provide services I will soon require. When the need arises I will of course look to hire them and pay them in bitcoin.

I also had a nice talk with an apparently well known bitcoin influencer whom I wasn't familiar with. I guess he made the rounds of podcasts before my time. I'm not going to out him here, but he gave me some insight into the community in general. He really impressed me. I saw him in action as he answered questions from newbies. He brought a fresh, inspiring approach, although I'm sure he's had these conversations a million times. He gave me insights into lots of other well known bitcoiners, many of whom are his close friends. He told me that bitcoin has given him friendships with people all over the planet. You could tell he just loved talking about bitcoin. He highly recommended attending conferences, though he dismissed the upcoming Vegas event as having "too many shitcoiners."

He then gave a shout out to Austin, declaring Bit Block Boom the best conference to attend.

These meet ups are unstructured. There's no formal agenda. It's just a group of people in a bar. That doesn't mean no learning goes on. I always learn something. I also got the opportunity to whip out my graphene Pixel and open the Robosats app for a quick lesson. A group of guys I was talking to were bemoaning the fact that they only could buy KYC bitcoin. Being able to show them how robosats works, in real time, is better than watching a YouTube video, in my opinion. My graphene OS phone also spurred some constructive talk about privacy.

Yeah, I was showing off. I felt like James Bond.

I almost decided not to attend. A confluence of sad personal stuff and an overall disappointment with the environment (core v knots, ETFs/Saylor) had me down.

I'm glad I went. There's nothing like bullshitting with fellow bitcoiners in person to lift your spirits.

115 sats \ 2 replies \ @bief57 19 May

I'm glad to read this. I'd also like to attend an event like this, although I don't know how or where these meetings are planned. Siggie, excuse my ignorance, but I have two questions: 1. Do you have a podcast? 2. How do you get a phone with a graphene operating system?

27 sats \ 1 reply \ @siggy47 OP 19 May

No, I don't have a podcast.

Re grapheme, you need to buy a recent Pixel phone with an unlocked bootloader, and then install it yourself.

After recently relocating I was feeling a bit miffed about how long of a drive it would be to get to the local Bitcoin meetup, but after I went the first time and ended up just talking to people for three hours straight, I had a similar realization as you.

What Color is Bitcoin (BTC) ?

1346 sats \ 9 comments \ @nullcount 19 May bitcoin #984049

Orange Coin Good, Number Go Up!

But can you name the exact Hue and Brightness of "The Orange Coin" ?

There are 16,777,216 possible colors in the RGB colorspace! And a large percent of those colors could be considered "orange".

The original bitcoin logos were more yellow-gold and used many hues and shades to convey "shiny" reflective coin effect.

2009
by Satoshi Nakamoto

2010
by Satoshi Nakamoto

2010
by Phil Wilson

The 2010 revision we know and love is simpler and uses a bright orange color **#F8931A** (according to the above image) I'm not claiming this is the "correct" color, just an instance of one JPEG I found.

BOLT #7 allows the node_announcement message to include 3 bytes for rgb_color. Every Lightning Network node can optionally broadcast a color.

The top 10 most popular node colors on the lightning network are:

#3399FF (a light blue color used by default in LND)
#000000 (nodes who do not broadcast a color or broadcast the color "black")
#68F442 (a minty green color used by default in old versions of LND)
#FF5000 (a bright red-orange color used by default in Voltage.cloud nodes)
#FF9900 (an orange color)
#0000FF (pure blue)
#FF0000 (pure red)
#FFFF00 (pure yellow)
#EF820D (a brownish-orange color)
#F8931A (the exact orange used in the 2010 bitcoin logo JPEG I measured above)

Other popular "orange" colors include:

#FFA500
#F2A900
#FFD700
#FF6600
#FF9F33

^ This color ranking is according to a lightning graph snapshot from a couple months ago

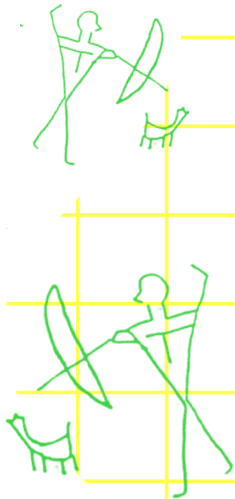

Each of these "orange" colors has at least a dozen or more LN nodes broadcasting them and self-identifying together under a common color (and creed?). What are the odds? There must be some sort of shelling point here.

Seems like the people are confused as to what color their money is and this is clearly hurting BTC perception in ways we cannot measure. Surely, this issue deserves a BIP and Core should do something to declare the official color and standardize it. Perhaps we can censor nodes who don't align with the correct color.

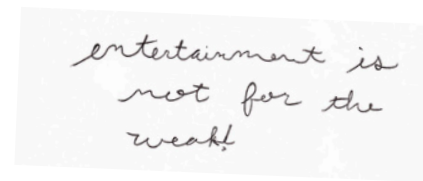

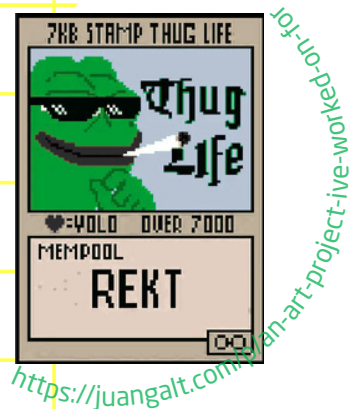

It remains to be seen what event will spark the color wars. But surely it will happen at a time when Bitcoiners can't think of anything more pointless to argue about.

What is the color of Bitcoin in your opinion, and why?

Bitcoin will never replace fiat

2179 sats \ 22 comments \ @SpaceHodler 16 May bitcoin #981618

That's because fiat sucks and Bitcoin doesn't.

Since Bitcoin lacks this important property of sucking, it can never replace fiat, because it can't fulfill fiat's best use case, which is as a short. It's just not fit for the purpose.

Fiat is issued as debt and more fiat (i.e. debt) needs to be issued to pay off old debt, otherwise the world would default. This never-ending spigot funds unprofitable businesses and projects that get access to fiat loans. Bitcoin will never do that.

People want to borrow fiat to benefit from the Cantillon effect. Once they've borrowed it, they dump it for something that sucks less. That "something" doesn't have to not suck; it just needs to suck less, which pretty much everything does. It's a very profitable trade that those who benefit from it want to keep in perpetuity.

This fiat short interest, i.e. people's desire to own debt denominated in it, Bitcoin will hardly attract, because it's not desirable to owe bitcoin to someone. We want positive bitcoin balances, not negative ones.

This is not to say fiat will never die. It just won't be replaced.

Just like smallpox, it got eradicated and hasn't been replaced.

Went to Steak n Shake today. Seeing SATS on the receipt was the craziest thing

5050 sats \ 46 comments \ @028559d218 20 May bitcoin #984906

Just like the title says. I went to Steak n Shake today, paid in sats for some fries and a drink... and WOW. I think it was something like 5k sats and even seeing 'sats' on the receipt... much less the dollar/sat exchange rate, much less the term 'lightning' on a Steak n Shake - printed receipt in the "real world"...

Color me impressed!!!

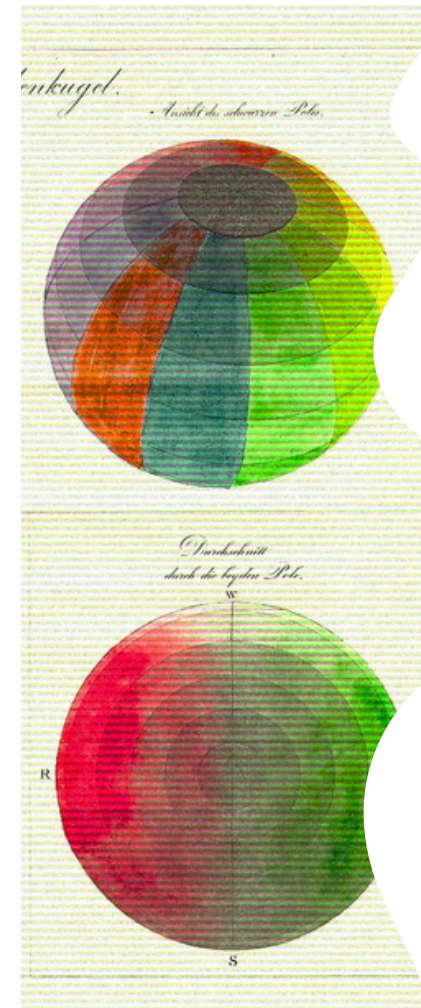

Paid with my own node, from home using LND, no it wasn't 'custodial', no it wasn't 'from coinbase'...

No it wasn't easier to just use "wallet of Satoshi" because "Lightning is captured"...

I ***** opened that channel myself.
And bought fries with it.
And that just totally blows my mind.

I really appreciate what Steak n Shake is doing, and I hope there will be more companies integrating Lightning to jumpstart the real Bitcoin economy.

That's all

Wrap up

Thanks for reading another issue of SNZ. I love making it!
If you're ever in Austin, come by Pleb Lab.
