Note from the Editor

Understand that a cap is necessary sometimes. Bitcoin is capped, and some would say that is its most meaningful feature, no cap.

For anything to be giving meaning, it must meet a limit.

There Will Only Ever \$ 21 Million REAL Bitcoin: Make Sure You Buy The Real Thing

398 sats \ 1 comment \ @BITCOIN 6 Apr bitcoin #936086

Bitcoin supply is approximately 21 million

85 sats \ 15 comments \ @Bell_curve 14 Jun 2024 bitcoin_beginners #574451

Can someone explain the background to BIP42 please? (21 million fixed supply)

12 Aug bitcoin #1077925

Why would 'any' actor keep paying 'real' money - Bitcoin - in order to pretend that a 'rune' exists and they can 'create' it by spamming the same transaction over and over?

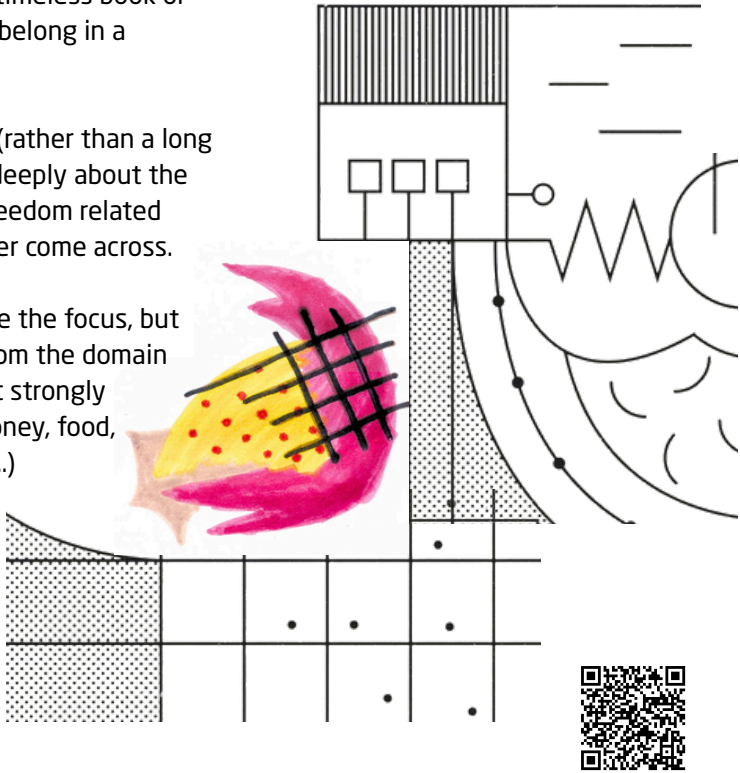

The Stacker News Freedom Library

1988 sats \ 24 comments \ @kr 9 Aug BooksAndArticles #1073956

Please share one timeless book or article that might belong in a "Freedom Library".

Just post one link (rather than a long list) so you think deeply about the most important freedom related content you've ever come across.

Freedom should be the focus, but feel free to pull from the domain that you feel most strongly about (speech, money, food, human rights, etc...) so we end up with a comprehensive library of really incredible freedom content.

The Ethics Of Liberty - Rothbard [1]

1. Not my first choice but because not everyone would choose this, I think it is useful because it explores questions around freedom and libertarian thought from the perspective of natural law: it tries to make sense of liberty.

A Cypherpunks Manifesto should definitely be added.

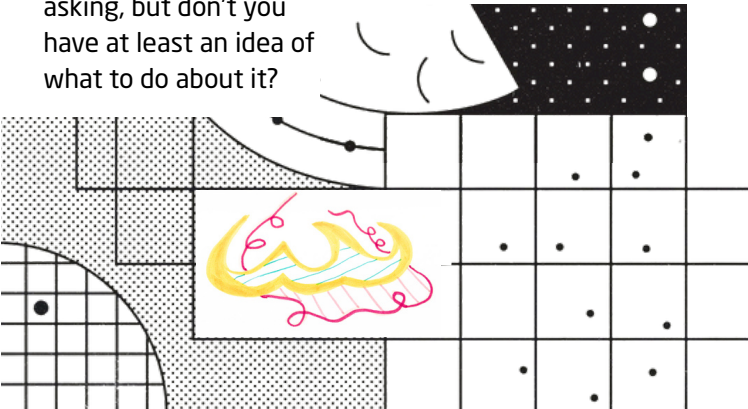

[FM] ✨ What if there was a new myth to believe in? ✨ (849 words)

4479 sats \ 8 comments \ @plebpoet 9 Aug BooksAndArticles #1074164

"Who else would be able to write this?" The professor asks to another professor, holding a few sheets of paper in her hand. "It's so fantastical, it's like a new myth. Seriously. Of course it's not the exercise I asked for,— but it's what I've been looking for, just as someone who believes in fiction." The other professor looks at her. "No, I can't believe I'm saying it either." She shrugs. "Will you take a look at it? I mean, it is incredibly interesting."

The professor seated at his desk coughs and rubs a finger under his nose, then responds, "All right, leave it here. It's unclear what you're wanting me to do about it, though."

"Well, yeah I'm not sure what I'm asking, but don't you have at least an idea of what to do about it?"

Discipline?
If it's discipline
I can take it
from there.
But that's
where I'm
conflicted,
because
this is so good.

Could I rightfully discourage it?"

The professor at his desk pulls a look of extreme exhaustion before he places his forehead in his hands and compresses circles into his temples.

The professor standing at the door with a few sheets of paper in her hand experiences a shift in her emotions. Bewilderment and frustration turn into fear.

She steps forward and drops the paper into a tray at the edge of the desk labeled "IN".

Quietly her feet lead her away, through the hallway of offices. A storm descends over her thoughts - *he has no clue, no one has any clue. No one has any answer. What the hell are we going to do— and no one cares! He doesn't; he has no patience. He lacks humility, but he could be spared so much time, and with that time he could- he could literally become a better person, like an actual leader. But he rots.*

Worry propels her feet forward, her feelings become her primary operation - a puzzle to solve, so much so that she doesn't see a bright new character in the hallway pouring her coffee. She's a student worker for the department offices. With her fresh cup of joe, she turns slightly to return to her desk. The professor bumps into her arm as she swiftly passes. Tweed jacket meets ceramic mug, then splash! with a short-lived steamy sizzle. The young girl dramatically sucks in air as the liquid burns her face and streams down her clothes.

"Oh god, I'm so sorry!" Professor clutches the girl's shoulders, then her hands stumble over her to remove the mug from her grip. The girl stands there helplessly with her eyes shut tight breathing in and out her mouth.

“Oh geez, okay here’s a towel, take this,” Professor reaches in a drawer and removes a kitchen towel, places it in the girl’s hands. She wipes her face. Professor stays with her a few moments more to be sure she’s all right, though she very much is not. Finally, they part ways. This is the girl’s first impression of her English professor. It stays with her throughout each semester – she comes to understand the professor as simple-minded, obtuse, scattered.

The professor stewes in her office, thinking unclean thoughts about the university's administration and the coming age of artificial intelligence. A pile of research work rests peacefully in front of her; she knows there's nothing new to be discovered within it.

She imagines her life on a timeline. On one end is human,
on the other end is machine.

She expects that her life will be plotted much nearer to the machine end.

The other professor returns, suddenly, and stops in the space of her open doorway. He holds a few sheets of paper in his hand. His eyes are white and round, taking her in as if she is not there. She hears him mumble something that she cannot interpret.

She stands and comes around her desk. "Sorry, I didn't hear you. Come in! Are you all right?"

"Oh yes, I —um. Well, I read this." He moves to take a seat, refers to the papers in his hand, the same that had been placed on his desk minutes ago.

She takes the seat adjacent and leans forward since he is speaking very softly, a tone she hasn't heard from him before. "Okay, I'm eager to hear your thoughts. I honestly wasn't hopeful that you would," the professor answers.

"You said it was like new myth,
that was interesting."
He coughs and straightens.
When he looks back at her,
his eyeballs are swimming.
"And it *was* interesting."

The professor is
bewildered into silence.

He begins an explanation again, slowly.
"I think this made me believe again."
He chokes out these words quickly,
then covers them with a
forced chuckle.

The professors look at each other, both unsure how serious is the other, knowing in themselves their own quiet alarm and amazement.

Should universities embrace or crack down on student AI usage?

842 sats \ 32 comments \ [@SimpleStacker](#) 12 Aug AskSN #1077690

Harvard University professor Alex Green thinks that AI is robbing students of their ability to think and that universities should crack down harder:

> More than half the nonnative English-speaking students and a notable number of native English speakers told me that after relying on AI to draft their papers and emails, their ability to write, speak and conduct basic inquiry is slipping away. They tell me this as if they have done something wrong, never considering that it is their professors, not they, who should carry that burden.

...

There is little evidence that senior university faculty are committed to tamping down the rampant overuse of AI. Instead, it is the paperweight on a pile of evidence that at an ethical level, universities are too timid or ignorant to insist that students use the core skills we are supposed to be teaching them.

What do stackers think? This is a live issue at colleges all over the country.

My stance so far has been that AI is inevitable and impossible to police effectively, thus de facto putting me on the "embrace" side. I'd love if we could somehow build an AI-free educational environment, at least until certain skills are demonstrably acquired.

I just don't think it's possible, and that AI is going to change the way everyone thinks and works, so the best thing to do is to prepare students for this brave new world.

ILLUSTRATION: ROBERT NEUBECKER

206 sats \ 13 replies \ [@Undisciplined](#) 12 Aug

I think the incentives around college need to be overhauled such that it's actually about learning, rather than being about the appearance of learning. That means more things like group discussions and oral exams. There are small liberal arts schools that do this pretty well, but it doesn't seem to scale well and it doesn't work with students who aren't interested in learning.

↳ 74 sats \ 6 replies \ [@SimpleStacker](#) OP 12 Aug

Yeah scalability is the main issue. I'm sure if I had 1:1 time with a student I can teach them a lot of stuff, even while letting them use AI. It's just that I can't replicate that across 50+ students. My wife and I are actually leaning more and more towards home schooling because of these issues.

40 sats \ 1 reply \ [@optimism](#) 13 Aug

Cracking down never helps, and embracing the scams is dangerous. What I'd want to do in their place is shape the use of LLMs - not forbid it, not encouraging slop. I think that it is important to teach non-end-user topics: how it works, training, finetuning, modifying.

...

41 sats \ 0 replies \ [@kepford](#) 12 Aug

Pretty much agree with you.

Thing is, I am pretty confident most of the people in education don't get AI nor do most users so they both underestimate it and overestimate it.

77 sats \ 5 replies \ [@Scoresby](#) 12 Aug

If universities are training kids to do things that can easily be done by AI, perhaps they should consider training the youth to do something else.

↳ 122 sats \ 4 replies \ [@SimpleStacker](#) OP 12 Aug

I think the question is similar to the calculator analogy. Why do we train kids to do arithmetic when calculators can do it much faster and better? Because we think the innate ability to understand arithmetic unlocks higher order thinking that the calculators can't do.

There's probably an argument to be made here about AI as well. It's just much harder to point to exactly what skills are being lost by AI use, and how they feed downstream into higher order skills.

cldash: a zap-aware CLN dashboard using only lightning and commando RPCs

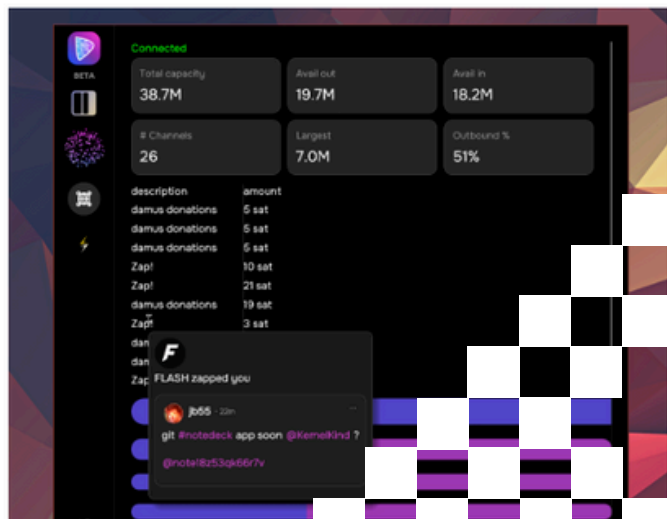

7231 sats \ 30k boost \ 16 comments \ @jb55 11 Aug lightning #1076694

Your Core Lightning dashboard, without the server nonsense.

cldash is a weird little experiment: a notedeck app that talks to your node **directly over the Lightning Network** using Insocket + Commando RPCs.

No HTTP. No nginx. No VPS. Just open cldash, point it at your node, and boom — you're in.

415 sats \ 1 reply \ @jb55 OP 11 Aug

Hey guys, at Damus I've been building a nostr micro-app browser called notedeck, not based on web technology, just rust + wgpu + egui and an embedded nostr relay.

I thought it would be cool to build a fun little CLN dashboard as an example. Let me know what ya'll think!

My Wife's Continuing Bitcoin Journey

1567 sats \ 29 comments \ [@siggy47](#) 12 Aug bitcoin [#1077396](#)

A few week's ago I posted about how Breedlove orange pilld my wife. My version was a little exaggerated, but the basic facts are true.

She recently discovered Jeff Booth, and is currently reading The Price Of Tomorrow. Every year she goes with friends to Aruba for a week, and she's down there now. I'm impressed that Jeff Booth is her beach reading.

We speak by phone every morning. this morning she told me that she had a conversation with a couple at the next table, and that the husband was very "into crypto." He told her eth was his favorite coin. My wife, who is far more blunt and directly confrontational than me, blurted out "Isn't that a shitcoin?" Of course the guy was offended and he tried to convince her of its value. She asked him if he had ever read Jeff Booth's book. He had no idea who he was. She then decided to talk to his wife instead.

Leonard always felt most alive in the air.

Suspended between earth and sky, a man could think.
The engines drowned out small talk. Seats and trays set the rules. No one could get to him.

Today there was only tomato juice in a plastic cup.

The seatbelt sign had been lit since takeoff. The woman beside him clutched her cross until the chain pressed a red line into her neck. A baby whimpered behind him and then hiccuped itself quiet.

Condensation slid down his cup. Each droplet fell at its own pace, but ended in the same place. People did that too.

Claire, with her soft blonde hair, her expensive perfumes, and her rotting heart. She'd be "at yoga" now, which meant Alex - the personal trainer with perfect teeth and hands that had never known a tool. A man who sweated more over filters than steel.

The fuselage groaned and flexed. Outside the small oval window, a flicker of white split the clouds - a thin, jagged line that vanished before he could blink. Leonard set both palms flat on his knees and held them there.

The pilot's voice came over the intercom, calm but clipped: "Ladies and gentlemen, we're about to encounter some rough air. For your safety, please take your seat immediately and fasten your seatbelt. We'll keep the seatbelt sign on until conditions improve."

Leonard closed his eyes. There was nothing left for Claire to take. Not anymore.

Two weeks earlier.

The garage smelled of oil and damp concrete. The chest freezer hummed. A moth battered itself against the bare bulb, left a powder mark, tried again.

Leonard crouched beside Timmy, nine years old.

"If Daddy dies from a heart attack or dies on a plane," Leonard said, "you're the man of the house."

Timmy looked up - brown eyes, serious, waiting for clear rules.

"These twelve words are a map," Leonard said. He showed two folded slips. "Not for Mommy. For you. Never give them to her. Not even if she cries."

"What if she says please?" Timmy asked.

"She will. Don't," Leonard said.

Timmy nodded. He wasn't quick, but he kept what he was given.

"Say it back," Leonard said.

"Don't tell Mommy. Even if she cries. Book first, then the slate. Words in order."

"Good," Leonard said, touching the boy's shoulder.

Timmy sat cross-legged in front of the TV his mother always put on when she was doing yoga upstairs. He looked up from his Nintendo Switch.

A red ticker slid along the bottom of the screen: Flight to Amsterdam makes emergency landing after turbulence injures 25 passengers.

Claire came downstairs with damp hair, robe loose. Alex followed with his mat under one arm, smiling like he had improved the household.

"Was Daddy on that one?" Timmy asked.

Claire stared at the ticker. "What makes you say that?"

"He said if his plane crashes, we get the treasure."

Her phone slid from her palm to the carpet. "What treasure?"

"The magic words," Timmy said. "For the magical internet money."

Alex smirked and then erased the smirk when he saw her face. . . .
