We need QR payments in Colombia

2354 sats \ 2100 boost \ 38 comments \ [@purpurato](#) 2 Feb bitdevs lightning

Background

Every single time I have tried to orange pill my normie friends, there's the question "but how can I use it?" and honestly there isn't a good answer to this yet. Saying that some fringe websites and a coffee shop accept it doesn't make any difference, one could even say that it reinforces their argument that it's pretty much useless. So tackling this issue is imho one of the most important things going on in the space. Square's announcement last year was one of the best news in years and makes me extremely bullish for the future, this is how we win. Dorsey is one of my last heroes that bitcoin hasn't slain.

I had a dream... to build a company that could emulate Square here in Colombia, but once you start on that path there are huge barriers with registration, banks, compliance and many other things non related to the product/service you're trying to bring to the market. Not to mention the anti bitcoin position you're in when you have to KYC clients just because they want to use magic internet money.

But I thought it was worthy and I built an LN node, I found some devs to get a website for that, and I was on the edge of getting all the compliance BS ready, I didn't want to operate outside the law. Then I saw this tweet by [@Calle #1414366](#) and it really hit. I always thought that wouldn't be possible because of some time constraints, but as they've shown, if you don't need instant payment, there could be a market between BTC P2P buyers and users that want to pay with LN on retail shops.

c o n t i n u e d

Payments

The QR payments are ubiquitous here, when it comes to small shops, bars and restaurants, everyone has it. This is how cash is disappearing. Transaction costs are zero and everyone can have their own QR by just clicking something on their bank app, individuals and companies alike. All the infrastructure exists, so there shouldn't be any more to build than the railways from users to BTC buyers. Moreover these type of payments are displacing debit and credit cards, it's just cheaper and simpler to operate.

FOSS

As I understand [@gandlaf21](#) is working on Openpleb which is a FOSS project for this, but the code on git seems to be a little quiet lately. There's also what [@plebqr](#) is doing in Thailand and apparently it works pretty well there but the code is closed, not sure if the former is working with/for the latter.

I'd REALLY like to have this here in Colombia, it would open the door to thousands of shops that use it! I believe the best way would be to leave it open source, just as the lnp2pbot exists today and different devs contribute to it.

My dev skills are beyond "Hello world" but way below to undertake this project, so I would like to gather a team to build this.

What I can offer:

- My LN node that is well connected
- Funding... up to my possibilities, or manage to find what's required from other sources
- Market depth to kickstart the project while more participants come. A buyer of last resort
- Everything local, I know the community here and would be able to promote among local bitcoiners, no need to talk to any merchant, no permits, no registration
- Write docs and teach newbs how to use it

If you think you have the skills to dev this project, please contact me, I'm open to propositions and willing to make this work.

All good for more adoption.

But going to use an intermediary that manage those QR codes put the whole movement in danger.

One day the payment provider will just stop providing, for various reasons...

Bitcoin: A Peer-to-Peer Electronic Cash System

Satoshi Nakamoto
satoshin@gmx.com
www.bitcoin.org

Abstract. A purely peer-to-peer version of electronic cash would allow online payments to be sent directly from one party to another without going through a financial institution. Digital signatures provide part of the solution, but the main benefits are lost if a trusted third party is still required to prevent double-spending. We propose a solution to the double-spending problem using a peer-to-peer network. The network timestamps transactions by hashing them into an ongoing chain of hash-based proof-of-work, forming a record that cannot be changed without redoing the proof-of-work. The longest chain not only serves as proof of the sequence of events witnessed, but proof that it came from the largest pool of CPU power. As long as a majority of CPU power is controlled by nodes that are not cooperating to attack the network, they'll generate the longest chain and outpace attackers. The network itself requires minimal structure. Messages are broadcast on a best effort basis, and nodes can leave and rejoin the network at will, accepting the longest proof-of-work chain as proof of what happened while they were gone.

Check out what MoneyBadger is doing in South Africa. They're integrating with existing QR payment systems, so they can be paid with lightning wallets. It works like a charm.

Get in contact with them, they're very approachable.

WTF is Bitcoin?

4496 sats \ 24 comments \ @72757cc6bc 2 Feb bitcoin

I've been talking to people about Bitcoin for years, and one thing has become painfully clear: our collective understanding of this technology hasn't advanced much. Conversations often circle back to the same misconceptions, the same confusion.

And in the wake of the Epstein revelations, I find myself increasingly concerned...not just about the state of society, but about how misinformation and disinterest distort the tools we could use to build a better one.

I genuinely believe that Bitcoin has the potential to become an essential instrument for human advancement. And if that is true, then each of us has a responsibility to foster comprehension where ignorance currently dominates.

That's why I've started building a website designed to introduce anyone, simply and clearly, to the principles of Bitcoin. It begins with the basics: what money really is, why it matters, and why Bitcoin represents the most resilient monetary system humanity has ever created.

This is a resource for your parents, your friends, your colleagues, anyone who feels compelled to dismiss Bitcoin without really understanding it. Education remains our most powerful tool. Use it. Share it.

Great resource.

< *And in the wake of the Epstein revelations, I find myself increasingly concerned...not just about the state of society, but about how misinformation and disinterest distort the tools we could use to build a better one.*

Welcome to the club. Been here for 10 plus years bud. Not sure of your age or anything but red pilling seems to come in waves. Don't take the whole bottle. What we are seeing now is nothing new. The tech is new, the cultural decline is different but similar things have happened.

Very bad people want us to give into nihilism. There is evil in this world. Its at work in our world and has been for all of recorded history.

Take if from a cranky old person fighting internal cynicism. Focus on your spheres of control and influence. You can't force people to see bitcoin if they aren't open to it. Exposing the evil in our institutions rarely results in significant change. You know what's up. Now, what are you gonna do about it? For you, your family, and your community. That's the best most of us can do and its enough. Evil wants us to cower in fear and believe the lie that "we can't". Build skills, build resilience, and build community. What we do is what matters. We can't just be about what we are against. We have to be about the work of the world we want for our kids and their kids.

Stacker News Monthly: January 2026

3948 sats \ 36 comments \
[@SimpleStacker](#) 3 Feb meta

Welcome to this month's
edition of Stacker News
Monthly! Today we're going
to take a look back at the month
of January 2026!

This month, 531 stackers wrote 1,306,876
words across 3,929 posts and 18,713
comments, earning a total of 2,411,635
sats, for an average of 1.85 sats per word, and 2.17
sats per word on posts.
Let's take a look at how things performed in January!
It's gonna be an interesting month, because
crossposting was released on January 4th. The
territory statistics are gonna get weird!

- Top Stackers
- Top Territories
- Top Words
- Crosspost Correlations

** this article is presented in brief **

Top Stackers

Top Zapped - *Measured by total sats earned on zaps across all items*
Congratulations to [@Scoresby](#) for stacking the most sats in January!
The official janitor of SN is (still) cleaning up!

Most Active - *Measured by total number of items posted*
Congratulations to [@Undisciplined](#) for being the most active stacker
in January! I'm also noticing that his favorite word varies a lot
month to month!

Highest Signal - *Measured by sats per post (minimum 5)*
Congratulations to [@SimpleStacker](#) for delivering the highest signal
commentary in January!

Most Prolific - *Measured by number of words*
NEW CATEGORY! In honor of Stacker News's literary heritage,
congratulations to [@Scoresby](#) for being the most prolific wordsmith on
Stacker News in January!

Top Territories

Top Zapped - *Measured by total sats earned on zaps in both posts and
comments*

Congratulations to [~bitcoin](#) territory for stacking the most sats in
January, and [~econ](#) for being the runner up! [~bitcoin](#) and [~econ](#) have
been #1 and #2 for two months running.

Highest Signal - *Measured by the highest number of sats per post
(minimum 10; AMA excluded)*
Congratulations to [~BooksAndArticles](#) territory for delivering the
highest signal in January!

Hottest Discussion - *Measured by total number of comments in
territory*
Congratulations to [~Stacker_Sports](#) territory for generating the most
discussion in January (by far)! Will the fiat sportsball territory
ever be dethroned as the King of Commentary?

Most Crossposted - *Measured by number of posts with more than one
territory*
NEW CATEGORY! Which territory tends to get added on as a tag more
than any other? Unsurprisingly, it's [~bitcoin](#)! But it's unclear
whether [~bitcoin](#) is the main category or the add-on.
[~Politics_And_Law](#) is the runner-up. Do you think that tends to be the
add-on or the main category?

Top Words

By Frequency - *Measured by the total number of times the term appears
in posts and comments*

bitcoin, sats, market, ai, money, world, real, state, lightning
"abs" has finally fallen off the top charts. But perhaps someone
should start a Predyx market on when it will regain its place as #1?

By Sats - *Each word is allocated sats from zaps based on its relative
frequency of appearance in posts and comments*
bitcoin, ai, bob, murphy, sats, lightning, money, world, yah, market
No surprises here, but bob and murphy showing up was a bit of a loop.
I think I know why though: [#1413](#)

c o n t i n u e d

Crosspost Correlations

Now that crossposting is live, have you wondered which territories tend to get crossposted together the most? Wonder no more: below is a chart showing the likelihood of one territory being crossposted with another. The table is not symmetric: it shows the percentage of crossposts containing territory A that also contain territory B.

The chart shows that bitcoin is a popular territory to include alongside others. Moreover, a lot of the smaller territories are getting added to crossposts, so crossposting looks like it might be a boon to the smaller territories that may not attract many posts as the main topic, but are worthy of inclusion as a secondary topic.

Unsurprisingly, [~econ](#) and [~Politics_And_Law](#) are frequently crossposted together, as is [~Stacker_Sports](#) and [~HealthAndFitness](#).

Notice that there is basically zero crossposting between [~Stacker_Sports](#) and [~bitcoin](#), confirming my hypothesis that sports is so fiat.

Anyway, hope you enjoyed this edition of Stacker News Monthly! Remember, stay humble and stack sats.

Money is a language

13.2k sats \ 512 boost \ 58 comments \
[@Scoresby](#) 4 Feb bitcoin econ

Where was the first money spent?

Before money was worth anything as money, it was worth something as stuff. This is the famous regression theorem of Ludwig von Mises. Bitcoiners end up talking about it a lot because Mises is one of the granddaddies of Austrian economics and the theorem seems to imply that Bitcoin can't be money.

It starts by asking how it is that people are willing to trade real things for something like money, which seems kind of made up. I'm happy to take money in exchange for my time or my stuff because I'm fairly confident that other people will take the money when I want some of their time or stuff. Mostly, I don't think about it much.

But...if you do think about it, you might ask: if the only reason money has value is because it is money, how did it get to be money? In order to use money, you need to have an idea of what it's worth, but you can only get this idea if someone else is already using it as money. And now we're just going in circles.

This is where regression comes in. Mises says money has value today because it was used as money yesterday. I don't find this very helpful because:

< To trace back the value that money has today to that which it had yesterday, the value that it had yesterday to that which it had the day before, and so on, is to raise the question of what determined the value of money in the first place. Mises, The Theory of Money and Credit

No kidding. Rothbard asks our burning question for us:

c o n t i n u e d

< Does not the fact that this causes partially regress backward in time simply push the unexplained components back further without end? If today's prices are partly determined by yesterday's prices, and yesterday's by those of the day before yesterday, etc., is not the regression simply pushed back infinitely, and part of the determination of prices thus left unexplained?

Mises says, "Don't worry! People only ever use things for money that were already considered valuable, so we'll just go back to when the thing wasn't money and see what it was worth then."

< The first value of money was clearly the value which the goods used as money possessed (thanks to their suitability for satisfying human wants in other ways) at the moment when they were first used as common media of exchange. Mises, The Theory of Money and Credit

Apparently, the grand answer provided by the regression theorem is this: money originally gets its value from the thing it's made of and money is only ever made of things that lots of people already want. I don't find this answer very satisfying. When it comes to money, it feels to me like we're not just dealing with a difference of degree (the most saleable good) but instead are talking about a different kind of thing.

It reminds me of another kind of regression problem:

"Who did the first grammar mutant talk to?"

I wish I could claim this formulation as my own, but, alas, Steven Pinker wrote it. You see where it's headed, though: if evolution works by mutations and extinctions, whichever of our ancestors won the lottery with a language mutation must have had some trouble finding a conversation partner. Linguists have to answer a question of the same nature as Mises: how does what you say when you speak a word get its meaning?

The sound of our words is somewhat arbitrary. It doesn't seem like there's a reason that the sound you make when you mean one thing should be the sound I make when I mean the same thing. Just look at how many languages there are or take a quick look at how people in different places record the sounds animals make (in French, crows say *croc*?)...if the sounds of different words are arbitrary, how did people learn what they meant?

Regression is the easy answer here: we learned it from our parents. But where did they learn it? From their parents, and their parents before them. But does this not "simply push the unexplained components back further without end" as Rothbard said?

...

What was Bitcoin's use-value before it was money?

Bitcoiners have felt a little awkward around the regression theorem almost from the very beginning. There's a great BitcoinTalk post from 2010 that, with a few mental acrobatics, excuses Bitcoin's regression theorem violations because it emerged in an economy that was already monetized (with plenty of prices to reference):

< The essential point is that once exchange can occur between a money (USD) and Bitcoins, providers of goods have a means by which to value Bitcoins as a potential medium of exchange. The money regression is satisfied, because taken back far enough we reach traditional commodity money: BITCOINS -> USD -> MONETIZED GOLD & SILVER [start monetary economy] -> [end barter economy] COMMODITY GOLD & SILVER.

Apparently, when Mises said "no good can be employed for the function of a medium of exchange which at the very beginning of its use for this purpose did not have exchange value on account of other employments," he actually meant "once we've got prices in the market, all bets are off and anything can be money."

...

Bitcoin is money. Always has been.

These regression theorem explanations feel like fancy carnival tricks or elaborate excuses to me. When Satoshi introduced Bitcoin to the world, he wrote:

< I've been working on a new electronic cash system that's fully peer-to-peer, with no trusted third party.

The title of the whitepaper is "Bitcoin: A Peer-to-Peer Electronic Cash System"

It was clearly intended to be money and anyone who reads the whitepaper is hard-pressed to believe that it was something other than money that they were dealing with. Why do we have to pretend that Bitcoin wasn't valued as money from the very start? Well, we have to do it because the regression theorem says it must be so. But -- now I'm going to say something that sounds stupid -- what if we are regressing toward the wrong thing?

I wonder if Mises made a mistake in focusing on the most saleable good aspect of money and trying to trace money's value back to some thing from the land of barter. Perhaps it makes more sense to think of it as a language.

Money is a language

I'm hardly the first person to notice the similarities between language and money.

Adam Smith thought it probable that the the human propensity to "truck, barter, and exchange one thing for another" was the "necessary consequence of the faculties of reason and speech."

< If we should enquire into the principle in the human mind on which this disposition of trucking is founded, it is clearly the natural inclination every one has to persuade. The offering of a shilling, which to us appears to have so plain and simple a meaning, is in reality offering an argument to persuade one to do so and so as it is for his interest.

-Lectures on Jurisprudence

You could easily say the same of words and language in general. Why else do we speak them if not to persuade? Nietzsche called trade "the oldest and most original personal relationship that there is, the relationship between buyer and seller, creditor and owner." And Mises said that "Money has thus become an aid that the human mind is no longer able to dispense with in making economic calculations" which sounds a lot like the way Chomsky talks about language as a framework for thought.

Modern Austrian economists carry on this thread. Steven Horwitz said, "Just as we cannot help but think in terms of the words that language provides us, we cannot help but act in the market in terms of the money prices of what we want to exchange." Money is rather more integral than a shiny rock would make you think. Horwitz continues:

< If money is an analog to language, then price is the analog to word. A market price embodies knowledge made available by exchanges through the medium of money, just as a word is knowledge made available by speaking or writing in a language. Therefore, just as a word does not correspond to some objective thought or meaning, so does a price not correspond to some objective quality of the object being bought or sold, or some objectively measurable cost. Prices are socially constructed unintended consequences of our attempts to act purposively within the context of monetary exchange. Words and prices both evolve through their use as "aids to the mind."

I find this a very useful way to think about money. I struggle to reconcile the regression theorem's insistence that money always comes from some valued thing (a most saleable good) with an understanding of value as subjective -- humans value whatever suits their fancy, however suits their fancy. While money may have used goods as a scaffold on which to build itself, goods are no more integral to money than sounds are to language. Humans can communicate with written words or flashes of light, they can use sign-language or ideograms -- and our money can be whatever makes sense to people -- even if it's agreeing on the state of a database every ten minutes on average.

Gold doesn't lie, neither does Bitcoin
