ISSUE #11

Note from the Editor

I'm just thinking a lot about robots, man.
I don't want the robot to do things for me, actually,
Like life is so blissful, you know? I'm not giving up
even washing the dishes because, yeah, I enjoy it.

Freedom, choice, autonomy - all mine, and they're
important to me. My disinterest in efficiency is the
thing that's gonna keep me holding out, and holding
out.....until you all become something I don't
recognize...

The future of autonomous bots and AIs funded with Lightning

2963 sats \ 17 comments \ [@SantaNotSanta](#) 16 Feb 2023 bitcoin [#137637](#)

Has anyone given thought to the concept of an
autonomous script/bot or AI that keeps itself running
without human intervention....

Life today is like a game played on a black-and-white chessboard

201 sats \ 1 comment \ [@Taft](#) 24 Jan ideasfromtheedge [#862688](#)

The game ends, the board is cleared, and the match
begins again. It is endless, this cycle of striving and
falling, of reaching and losing. The players don't win
because they don't know what winning means.

Honey, it's me or the bot!

165 sats \ 3 comments \ [@dontforgetthekeys](#)
29 Aug 2024 FiresidePhilosophy [#665384](#)

What if you woke up one day and found that
there is a bot trained on everything that you
have shared online since your first post on
myspace? It's taken your name, it's taken your
memories, and it's coming for your job.

One stacker's pain - the Euro is coming and the prices are already going up

1278 sats \ 30 comments \ @stack_harder 30 May econ #992616

I am in Bulgaria and, for those unaware, the Euro is coming and, quite frankly, I'm already sick of it.

For at least a few years I've been reading about it, and Bulgaria was always failing to meet some criteria, but the final phase is here. People have protested, lots of noise has been made, but as usual, the plebs will be shafted.

Every day, I see debates about it, people arguing on Facebook if it's good or bad, and then the endless media pieces about how it's either going to explode real estate prices or kill them. Endless experts going back and forward.

The real estate agents, the vultures they are, are having a field day spreading FUD about how the Euro will explode prices, and people are trying to smash buy flats for fear that it will then become expensive.

Meanwhile, what I can say anecdotally is this: places are already using the Euro as an excuse to raise prices, and they are probably doing it so that they don't get accused of price gouging after the Euro arrives.

Here, I can't blame the Euro per se, but it's a good pretext to hike prices. The Leva (Bulgarian currency) is already pegged to the Euro anyway, so I don't see what kind of amazing benefits it will confer to the average person.

Case in point, my haircut has cost 14 leva (about 7 euros) for almost a decade. 6 months ago, the price had been increased to 20 leva (10 euro), and the most recent hair cut was 30 Leva - 15 euro).

I don't care really, it's not a lot, but it's the same little bit of increasing everywhere. In percentage terms, it's quite a jump. If I treated my clients like this, I wouldn't bloody have any left!

My kids school fees are going up 10%, and it looks like other schools are also doing 10% - every year prior they have increased 5% and, while I can't prove it, this feels like a 'fuck you' tax.

As a result, I'm moving the kids to state schools and if it's shit, I'll home school them, not like the education quality is amazing anyway.

On top of this, I'm sure things will get more expensive because they have done every single time the Euro was introduced, whether from greed, or just rounding up decimal places. Experts sitting there smugly saying how the gov will be on top of it all and whatnot is pure waffle. The gov here, like in many places, is shit and will do nothing, all they're good for is raising taxes and trying to dig themselves out of the fiat debt-pit they created themselves.

So yeah, it does make me a bit sad, just something else to be forced on people, rules for us, not for them.

Still, this is why we stack, and I quite often take great joy in knowing that I am building my non-KYC stack safely away from the legacy bank systems

One year into stacking bitcoin.

1806 sats \ 37 comments \ [@Aardvark](#) 2 Jun bitcoin [#995199](#)

I just crossed the one year mark of my first bitcoin purchase, and it's been one hell of a year.

First year accomplishments:

Listened to a dozen books
Listened to hundreds (if not thousands) of hours of content including podcasts, and YouTube videos.
Discovered Stacker.news
Discovered Lightning network
Discovered non KYC

Year 2 goals:

Stack harder than year one.
Finish [@DarthCoin](#) guides (finally)
Create and experiment with an uncle Jim node
Fully move from windows to Linux (hard October deadline, I'm not getting the new windows OS)
Increase my security
Side quest: eat koobideh

Long term goals:

Eventually I want to be able to onboard a small business to accept lightning payments.
TBD.

We will see how year two goes, but I don't think my goals are unrealistic for myself.

reply \ 126 sats \ 8 replies \ [@Undisciplined](#) 2 Jun
I'll join your Linux goal, at least for my old laptop.

→ 42 sats \ 4 replies \ [@The_Young_Bitcoiner](#) 3 Jun freebie
Linux is the ultimate freedom one bitcoiner must acquire. Get free from the hands of Microsoft and such, just feels good. I really recommend you trying out multiple Linux distros before picking your favorite, there are plenty of them and you may enjoy the process of testing all of it.

→ 0 sats \ 3 replies \ [@Undisciplined](#) 3 Jun
I definitely will not enjoy the process of testing a bunch of different options. What are your top three choices?

→ 42 sats \ 2 replies \ [@The_Young_Bitcoiner](#) 3 Jun freebie
1. Linux Mint (I've wandered many distros, but I always come back to this one, currently I'm using it on my work and personal desktop)
2. Debian (very stable)
3. Ubuntu (very user-friendly, although not very lightweight)

reply \ 42 sats \ 1 reply \ [@Signal312](#) 2 Jun
The Linux goal - is there a hard Oct. deadline, when you can't run Windows 10 anymore? I might have to adopt the same goal...or at least make my Windows machine my non-primary...

→ 34 sats \ 0 replies \ [@Aardvark](#) OP 2 Jun
Yea, there's not going to be support for 10 anymore, so its going to get less and less safe as time goes on. Im going to get a second SSHD and install linux on it and slowly migrate over.

Are we thinking about MoE all wrong?

1872 sats \ 23 comments \ @birdeye21 3 Jun bitcoin #996346

I've used this image in the past, and I've recently been thinking about how bitcoiners fall into the same psychological trap.

There's an overlying concern about the future of bitcoin and how there's simply not enough for everyone. And it's true, **Bitcoin is not for everyone** (#342798).

I recently read a book called Stellar. It's about the future, breaking out of the current paradigm of perception, and how a fancy technological concoction of solar, wind, AI, etc. is brewing to create to largest deflationary impulse the world has ever seen. Infinite abundance, echoing Elon Musk, Jeff Booth, and others' words of a world where anything becomes accessible to anyone.

I gotta say: the book specifically is big on theory, but falls short in practice imo. Before we ever get there, I believe there's a world of painful social unraveling to work through first.

At the same time, it was valuable in crystallizing ideas I've held for awhile. I agree with the basic premise that we're heading toward a world of prosperity the likes of which we never thought possible. Like 99% of stuff being straight up free. No cost, no need to "spend currency" on it.

If that's truly where we're headed, what does MoE look like?
How does Bitcoin fit into this equation?

Could it be that our perception of "spending money" in exchange for goods and services itself is becoming an antiquated relic of history?

I see Bitcoin as the financial bedrock upon which freedom will be upheld for the world. All the costs in the world could go to zero, but the AI could still be force feeding bugs into our stomachs without guardrails in place that they can't work around.

For a long time, this is a critical purpose of Bitcoin I've recognized. It makes all the difference between an abundant world of freedom, and an abundant world of slavery. Profits are channeled into a decentralized network shared by everyone, instead of corporate AI robot goonies that use it to project power over the individual.

Perhaps we (or maybe just me) have been thinking about Bitcoin's trajectory all wrong. Like others in the space have mentioned, is Bitcoin something that most won't even tangibly use on the surface level?

Sure, there will be a transitional period of

buying my milk for **1,000 sats**,

then **100 sats**,

then **1 sat**,

but what comes after that?

Discussion

reply \ 157 sats \ 2 replies \ @Undisciplined 3 Jun

Things will still cost money, but business models might change dramatically.

Similar to how we still pay for cell service, but not for minutes, we may transition to subscriptions/memberships with businesses that provide goods and services at no extra charge.

reply \ 122 sats \ 0 replies \ @k00b 3 Jun

It's a fun thought experiment. When I think about AI so productivity enhancing that it brings costs to zero, I think of ASI. When I think of ASI, I'm confident we're trapped in lots of versions of water we aren't aware of. I think ASI is a bigger threat to bitcoin than quantum processors. Mostly because it can't be predicted or planned for beyond the horizon of it coming into being.

If Satoshi were 10000x smarter, might they have made money differently?

Why wouldn't 10000xSatoshi make a 10000x better bitcoin?

If it's producing everything we need, and outnumbers us, isn't it running all the economic nodes?

How does one personally value Privacy and avoiding KYC?

1599 sats \ 16 comments \ @Wumbo 4 Jun privacy #997029

Background

For many decades now, I have placed an high personal value on privacy and on not using service's that require KYC. This is has often created friction between me and friends/family.

All Individuals have their own personal tiers of what is important to them and many times these tiers don't line up with others in a group or society. This concept, that others don't always think like you, is often a basic life lesson we teach people since they were a young child.

However, privacy and avoiding KYC appears to not be an acceptable goals to many people.

Two recent examples for context:

1. Not attending Friend's Graduation Ceremony - This Graduation was going to require air travel and was being held at "secure" facility. Both of these items were going to require ID and background checks to attend.
2. Business Trade Show - During the check in process to get one's badge for a trade show there was a "required" form to fill out. Usually I would just put junk data in and go about my life but this form was requiring a valid email/phone. I ended up just filling in the form with an actual email/phone (versus using a burner one) because I had my management team impatiently waiting in line behind me.

These are just two of hundreds of examples in the past decades.

Issue at Hand

The common reaction I get from friends/family is that I am being completely unreasonable in protecting my privacy and not participating in KYC. In my personal experience people seem shocked that I would not go to a friend's graduation or extremely frustrated with holding up the line at the trade show.

A large percentage of people appear to value doing things more than privacy. As mention above, we all have different tiers of what is important to us in life and this diversity amongst people makes the world an interesting place to live.

But the reaction I am experiencing to privacy is hostile. Example: Why would you put privacy in front of friends/family?

I have had very little success in convincing friends/family that their frustration should be directed towards the entities require KYC and not the Individuals who want to remain private.

I welcome any thoughts, comments, and/or advice on this topic.

Discussion

reply \ 70 sats \ 2 replies \ @teemupleb 4 Jun

If they just check my age in a bar when showing my ID, it's fine, but I'm not comfortable letting them take a photo of it etc.

Otherwise I will soon be "coinbased" and my personal info is sold on darkmarkets by minimum wage Bangladeshi support agents.

I'm not comfortable with sharing my biometric data either.

A common trend in the city where I live is that the best quality gyms use facial recognition to access the gym. The alternative is to go to the 80s style poor-quality Arnold gyms, so often convenience here trumps privacy.

reply \ 89 sats \ 2 replies \ @DarthCoin 4 Jun

Change your life style. Change everything you do if you feel that you have less and less privacy. Complacency is the enemy of privacy.

Do you live in a city? Move out to rural.

Do you work 9 to 5 for a corporation? Start your own independent business, be your own boss. You will work less, earn less but your life will be much free. More money doesn't mean you are more happy. More free time it means more happiness.

Especially if your actual job require traveling (you are forced to give up liberties) then you are a slave.

If you really have to travel, use a bike, a personal car, walk or share-riding.

Finally if you still feel overwhelmed by privacy violation, you will find your own way to do it like me: build your own homestead far away from so called "civilization". In other words... FUCK'EM'ALL.

Obvious question is Obvious: Where the hell is everyone???

1565 sats \ 56 comments \ @028559d218 4 Jun bitcoin

For the life of me... I can't understand what is going on with the blockchain.

It's a simple question really: where the hell is everyone?

Think of all the daily transactions, all the settlement across borders, the daily spends people make, the Lightning channels that need to get opened (trivial really), the channels that need to get closed or 'resized'...

The availability of Phoenix, Zeus, much less self-run Lightning nodes, plus all the onchain activity...

I saw a transaction for 9 Billion (!) dollars of Bitcoin settled the other day for around 2\$. It was secure. It was verifiable. Sure... maybe wait 9 blocks or 12 to be extra cautious with regards to a reorg but even then it's final settlement in like 2 hours. What legacy systems can do that?

Companies and individuals make these kinds of settlements and payments every single day all around the world, 24/7 and the Bitcoin blockchain is always working and available even with other settlement systems simply don't have the uptime/availability.

24/7 people trade real estate, gold, stocks, bonds, trinkets... when it's daytime somewhere it's nighttime somewhere else so the demand really 24/7 to use the Bitcoin blockchain really should be overwhelming.

Need to trade a building in Tokyo for property or cash in Berlin? Ok SURE there's demand for that. Settle that 'digitally' on Bitcoin it's faster and cheaper.

And if you want a few Lightning channels, either own your own or with an LSP then open them and you have quick and cheap payments that overwhelmingly work (in my experience).

So where the hell is everyone?

3 thousand on-chain transactions in a block, maybe stretched to 200 million a year, among 8 billion people, 200 million companies, in 70 countries...

The demand for on-chain should be overwhelming.

So where the hell is the rest of the Human Race???

Bitcoin poem 30 "Bitcoin is Free Will"

303 sats \ 4 comments \ @Athena 1 Sep 2024 bitcoin #669214

When powers try to steal our wealth
With high inflation's chill
We now claim a better way
With Bitcoin as free will

When people try to censor thought
And freedoms go downhill
We get on the sovereign path
As Bitcoin is free will

When tyrants seize or confiscate
"Trust us" (a bitter pill)
We hold an asset we can own
And Bitcoin is free will

When moving funds across the world
With no "permission" drill
We can use an open money
Since Bitcoin is free will

When planning for our children's lives
So they can be fulfilled
We'll save the surest money
For Bitcoin is free will
