Note from the Editor

Bitcoin is a pretty crazy space
to be in. A lot of different messages float
around. Signals get more difficult to discern.
People become robots, man courts machine.
I'm a creative person, not really a computer
person, but I know exactly what I'm doing here.
I'm not interested in your efficiency.
I'm flaunting my freedom.

A SOVEREIGN BRAIN ON A LAPTOP:
LOCAL LLM + PI AGENT + MARKDOWN

5597 sats \ 10 comments \ [@rolznz](#) 1 Jun AI

sovereignbrain.me

Sovereign Brain is a simple blueprint for a local AI second brain
that runs on your machine.

It holds your projects, TODOs, goals, thoughts, and learnings.

It pushes back on your ideas, helps you see things from new angles, and keeps
you working on what matters.

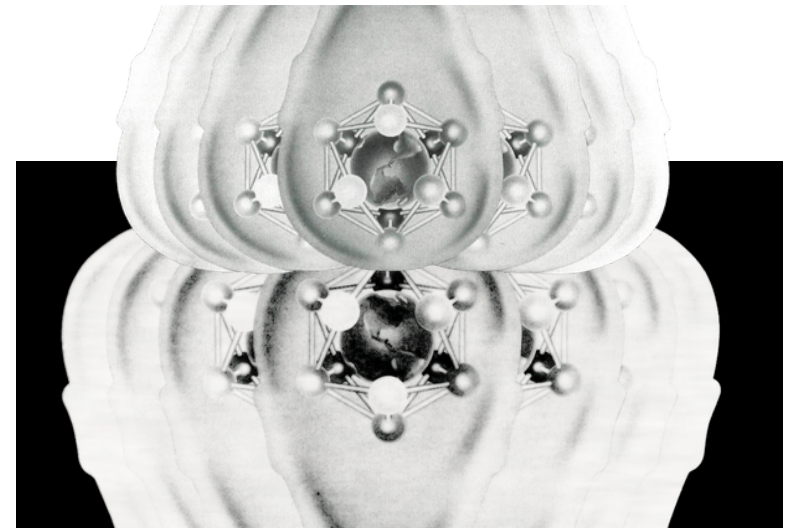

2026 is the year of sovereign AI. Local AI is now fast and smart enough to run on a
laptop.

It won't beat the cloud. But it's the only AI you'll share your personal thoughts
with.

All local and open source: LLM + Pi Agent + Markdown.

For me this is a huge unlock: I wasn't comfortable to share this with Claude or
ChatGPT. So I thought, maybe other bitcoiners are also interested and surprised
that it actually works.

Watch a demo + Create your own at <https://sovereignbrain.me>

CHEMTRAILS OR CONTRAILS?

1191 sats \ 22 comments \ [@billytheked](#)
1 Jun AskSN ideasfromtheedge

If ever I am talking with an individual who believes in this conspiracy who nods and goes along with them, because quite frankly I have no clue.

individual who strongly believes in this theory, I am the person who goes along with them, because quite frankly I have no clue.

The other day I looked up at the sky on a sunny day and saw a plane leaving one long, clean incision across the sky. Cursing this --I really hate how it looks, whatever it is-- I started to notice this white substance was sputtering. It stopped and started a few times, like the pilot was fiddling with the button or had a few split seconds of hesitation in fulfilling his orders to blast those damn little ants with aluminum or whatever.

So I finally think to look up officially what is going on, and I find that these white papercuts overhead are claimed to be condensation from residual water vapour left behind from the jet fuel as they are referred to as "contrails" --chshshsh, it is a good name they went with, the FAA and the youtube video has that spooky psyop music in it and the comments obviously are filled with skeptics that it seems one might be outnumbered if they professed these contrails as true.

The strange thing to me is that I had to look this up, that after decades of being on this planet, and learning cumulous, stratus, cumulumbus clouds' names no one thought to say to me, the little scientist I was, heh, kiddo, those lines are the same thing that you see when you exhale on a cold winter morning, just water vapour like the clouds.

The plane poops out clouds, laddy, plane poo.

They are clouds all the same, but excreted not from God's fingertips but from the jet engine that hurls over continents through turbo-engine propulsion. Duh.

Was it just so simple no one thought to say it - like how the little black dots on strawberries are there because they fell from the night sky?

There's a local well-known bitcoiner that's been going pretty hard on chem trails. Personally, for entertainment value alone, I like both good and bad conspiracy theories. But I hate them being a sidecar to bitcoin. Bitcoiners are already seen as monetary flat earthers.

Anyway, not having looked into it, I suspect we have sprayed things from planes in an attempt to modify the weather. Have people done this intending to cause natural disasters? Optimistically, I'd say no. Have people done this and accidentally caused natural disasters? It's plausible. Is weather modification super common? I'd guess not.

Also, if someone is serious about chemtrails, they should stop calling them chemtrails. Call it weather modification or whatever nuanced thing you think it is else you get lumped in with people claiming they're spraying autism and satanism into the atmosphere.

If someone comes up with a catchy enough name, I bet we can convince a scary amount of people that most stars in the sky are cameras.

CONSPIRACY THEORIES

301 sats \ 4 replies \ [@kepford](#) 2 Jun

Why not both. It's uncontested that the CIA sprayed stuff on US cities. But also, it is very unlikely that all contrails are government or corporations spraying things in the atmosphere.

Cloud seeding is another conspiracy theory that really is not a theory. Its just that people like to claim it is done when they can't prove it.

I've written about conspiracy theories a few times here and what I have noticed is how a certain group of people seem to believe every theory they hear and make it easy for normies to keep their heads in the sand. Both extremes are not helpful.

The stuff the state has admitted to doing is bad enough to distrust it. We don't need to stretch it out. The majority don't even care about what is admitted. What makes people think that if they could just convince them of some other theory it would make a difference?

Most of these theories are based in truth but stretched out to absurdity. My meta theory is that state actors do this to hide the truth.

Bottom line, if Isreal killed A guy, or the US gov is spraying chemicals on the populace it makes no difference to my world view. I have long believed they would do anything to maintain power from history. None of these theories can make me more convinced the state is evil. Already red pilld.

DOES BITCOIN HAVE TO 'GO UP' TO BE A GOOD CURRENCY?

1782 sats \ 69 comments \ @028559d218
2 Jun bitcoin

Just asking the question as a thought experiment.
Let's say bitcoin loses 3% of its value every year for the foreseeable future, maybe even loses *a lot* more than that.

You can still custody it yourself, still spend it, its still secure and censorship resistant... You can spend it peer to peer etc you can still 'use' it basically...

What's wrong with that? As a matter of fact, if it were to loses value each year, especially gradually over time then it would be even easier to use spend and deploy in a 'currency' like way. Plus there would be no capital gains taxes so noone would have to worry about that (eventually).

Wouldn't that make bitcoin more easy to use?

129 sats \ 27 replies \ @Scoresby 2 Jun

No, I don't believe so. Sure, if no one wants bitcoin, it will fail and not be worth anything. but number go up forever doesn't make sense to me. There is some level where all the people who need bitcoin for what it does (censorship resistant holding and transfer of value) have it.

223 sats \ 7 replies \ @justin_shocknet 2 Jun

Yes.
Countless shitcoins can be self-custodied, spent etc... and are probably better if that's what matters most to you.
w/21M is its differentiation, a Schelling point of value that makes it liquid (liquidity is a feature), that's a proxy for NGU.
Understanding this is to understand Bitcoin, otherwise you'll always try to change it or shitcoin for something newer faster better.
Everything about Bitcoin is ultimately in service of NGU, if NGD it's all meaningless.

129 sats \ 0 replies \ @OriginalSize 2 Jun

Yes to the title. No to the final question. For Bitcoin to reach its potential it has a lot more NGU to do. I prefer my assets appreciate not depreciate. I think a lot of what makes this work so clownish is that people try to act in the interests of total strangers. Sure it's be great if other people had Bitcoin and used it but what's better than that is for me to get as much as I can first.

124 sats \ 10 replies \ @optimism 3 Jun

Yes it does. Otherwise you have the pain of finite supply without the benefits. That doesn't mean that it should do a 2x every year - the insane volatility is simply the result of high time preference narratives causing hype.

@Scoresby shared an analysis from Lyn Alden last night, which I'd translate as follows:

from an SoV perspective, you want some certainty. SoV is anti-casino because the point is savings, not speculation, so there's risk management to be done. Bitcoin is anti-yolo. (and thus, it doesn't matter what feature forks are envisioned.)

There are 2 primary perceivable risks that are reducing the value of Bitcoin as an SoV right now:

1. The perception of it not being secure, especially in the face of all the quantum FUD
2. The perception of it being in a bubble

Right now, both risks have been hit. The former is the hardest, because with all the fudsters out there, the perception is not going to go away. The latter will solve itself as some that were using Bitcoin as a SoV are exiting - to get some liquidity to pump into the AI bubble - and price will drop bit by bit, as it has for a while now. Saylor FUD is helping with that too.

Although I hate the PQ narrative, it would be good to make some progress on fixing at least clear p2tr pubkeys.

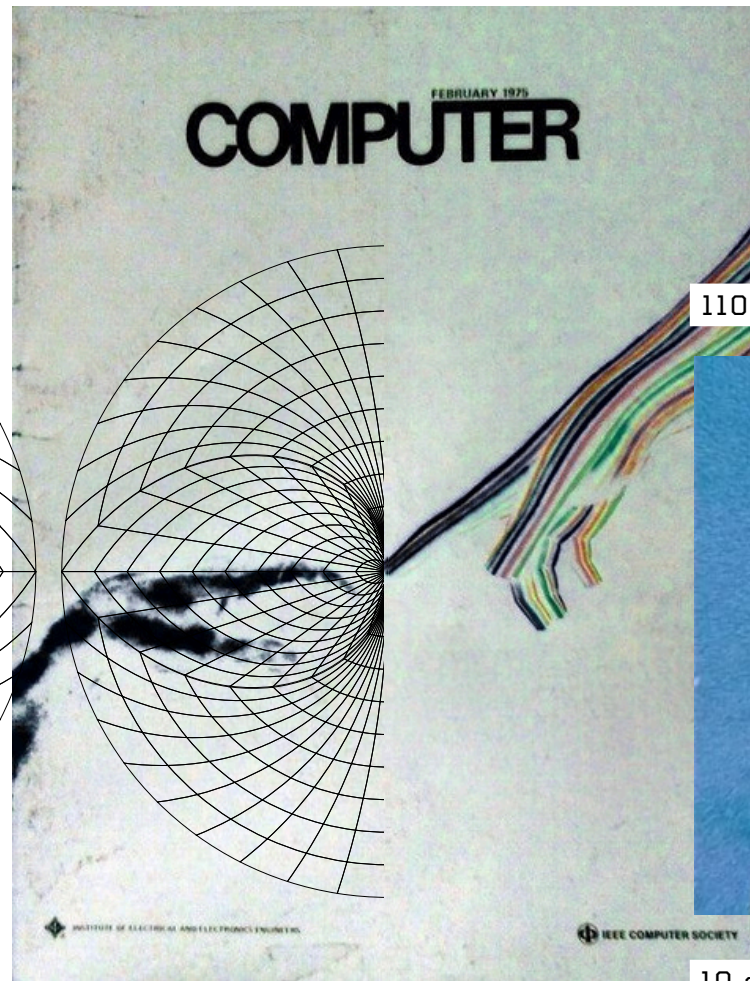

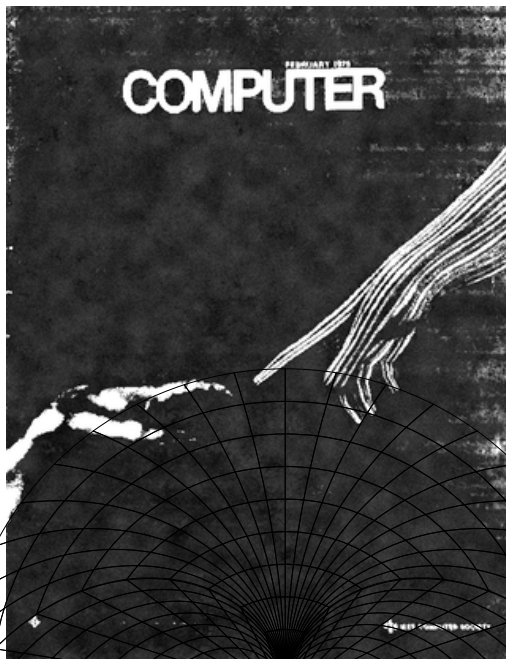

< [...] bitcoin loses 3% of its value every year [...] What's wrong with that?

What's wrong with it is that if Bitcoin isn't an inflation-proof SoV, then no one will use it as the vehicle to save in. The volatility is already pretty bad from a mid-term perspective, but if there is NGD (against your cost of living) then there is no reason to use it. Instead, you'd just do a sats->gold swap out when you receive your coin income and you do a gold->sats swap in when you need to spend some. Maybe Tether has their tokenized gold on taproot assets now? Wouldn't even have to leave LN then.

< *there would be no capital gains taxes*

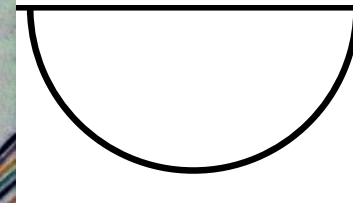

I think that you need to think this one through a bit, lol

BITCOIN HISTORY MONTH ON STACKER NEWS - 400k SATS IN PRIZES!

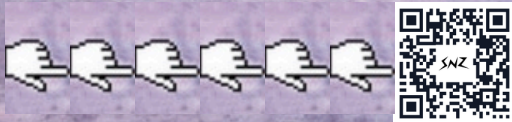

5327 sats \ 22 comments \ @Scoresby 18 May the_stacker_muse bitcoin BooksAndArticles history

June is Bitcoin History Month on Stacker News! 400k sats in prizes!

There are too many Bitcoin stories that have never been written down. Here's your excuse to go deep researching some piece of unknown Bitcoin history everyone needs to know about.

"What mining does is convert electricity to heat, but not just any heat... specifically something between 90C to 120C, or heat around the boiling point of water. This heat density is too low for most industrial uses, except possibly things like water purification. It cannot be used for smelting, semiconductor processes, or anything that requires very high heat density without a heat pump."

This is from a 2014 reddit post. The post goes on to speculate that Bitcoin mining will always be an unprofitable business because so many people can use the waste heat from miners that there will always be miners willing to mine with negative returns. He uses the water heater industry as an example.

Fast forward to 2026: in reply to a recent post about bitcoin mining heat reuse in water heaters, @Undisciplined expressed interest in learning about who was building such things (#1499435). How is it that we are still wondering if anyone is working on this?

The Beginnings of Heatpunking

As early as February 2011, a user on BitcoinTalk was posting about using Bitcoin miner heat to heat water that heated his bathroom floor. Sadly, I haven't been able to retrieve the pictures from this post.

In the same thread, another user suggests using miners for water heaters:

Activity: 1386
Merit: 1005

Re: Liquid cooling HD5970
February 24, 2011, 04:46:40 AM
Mentioned by vapourminer (1)

Quote from: moa on February 24, 2011, 02:32:58 AM

Sturle, wow ... I was wondering about feasibility on this ... typical domestic hot water can be in 4-6 kWatt range ... about 7-8 HD 5970 cards ... combined heat and GPU power CHGPU solution (i.e. not CHP). Clever way to turn useless heater element resistor in hot water tank into GPU transistor and get computational power (bitcoins) as a bonus.

In theory the way to do this is....

Have the GPU's heat water in a pre-heat tank maybe 50 gallons. Then have a continuous on demand water heater (gas or electric) that can take variable water temp in and make constant temp out (they exist!) and you get most of your hot water for free. Even 500W of continuous heating power could be utilized this way.

Seller since 2011 hundreds of orders shipped

There were other threads about it in 2011, too. With a user asking pretty much the same question as Undisciplined: who's doing this and how can I help?

Throughout 2011, there are quite a number of threads about heatpunking on BitcoinTalk and reddit. On YouTube, a user named storky16 uploads a video about dehydrating fruit with bitcoin miner heat.

And someone on reddit posts about buying BitBerries -- strawberries that were dehydrated via waste heat from bitcoin miners.

The story even made it into a local newspaper:

'The strawberries are apparently sold at the local grocery store and can be paid for with bitcoin; the back of the package says: "These berries were produced using filtered, recycled heat produced by computers that perpetuate Bitcoin: the world's first alternative, decentralized currency."

The bitberries are not available online, but the strawberry farmer is looking into ways to put up an online storefront. Golden berries and goji berries are also available for bitcoin.'

Heatpunkery getting professional

Also in 2011, Microsoft published "The Data Furnace: Heating Up with Cloud Computing." The paper describes how servers could be sent to homes and office buildings to be used as primary heat sources.

A fellow named Matt Fisher liked the idea so much he started a project called The Data Furnace. It's website described it as:

"a project started by Fisher Innovation to test if it is possible to heat a standard size city apartment during the cold winters in Canada with only distributed computing as the source of heat."

I don't know how long the project lasted. It seems like the wayback machine crawled it as late as the end of 2014, but the crawl doesn't return anything. At some point though it seems that Fisher was heating his apartment with bitcoin miners:

"The current Data Furnace setup generates its heat from working in a distributed network. Most distributed networks on the internet today give out no rewards for donating your computing power, you're simply just helping out a good cause. However the Bitcoin digital currency network does payout the workers, the payouts are small but overtime add up to usually be more then the cost of hydro to run the machines."

A mining company called Hotmine claims to have been founded in 2013 and *"In 2014, we have developed a model of the miner based on immersion-cooling for the heating of residential premises based on a 55 nm ASIC chip, with a performance of 81 TH/s"*

I found some YouTube videos from a channel they had in 2015 showing these systems.

You can still reach the hotmine.io website, but it doesn't look like it's been updated since 2019 or so, although I found this reddit post about one of their heaters from late 2019.

...

So, where can you get a Bitcoin water heater today?

< much more to this post online, go check it out through the QR >

196 sats \ 2 replies \ @Undisciplined 1 Jun

We're so close. It's interesting that this really isn't new or unique to Bitcoin. We've had demand for idle compute for a long time and waste heat has always been an issue.

Why haven't there been any bigger investments into making waste heat useful?

LLM WEIGHTS SMALL ENOUGH TO FIT IN A BITCOIN TX

4307 sats \ 2 comments \ @rijndael 2 Jun AI bitcoin

I wanted to see if you could make a language model
small enough to fit in a standard bitcoin transaction (so smaller than 400kb).

technical details to follow but if you want to skip to the punchline it came out pretty good! The inference code runs locally in your browser and the ui (which contains the inference code) and weights are both onchain via inscriptions. You can try it out here:

<https://ordinals.com/content/25562e25a6fbb39d12ef8cf50883c93e5d3508c1211529aa506a680af0ba55aa0>

Most modern language models are in the billions (or trillions) of parameters. This one is in the hundreds of thousands. Custom model written in pytorch, with 4 transformer layers, 4 heads, embedding dimension of 112. Has a context length of 128 tokens and a vocab of 2000 tokens (plus one for unknowns). Those hyperparameters were found by picking some defaults and then doing an autoresearch loop to figure out the right combination to maximize readability (same process with the sampler parameters). The weights were then quantized to 4 bits and compressed, getting an artifact just under 400kb.

The training corpus was around 1M tokens. One of the problems i ran into is the model is so small it had trouble learning grammar for longer sentences. So part of the data prep was rewriting the corpus into shorter claims and statements that still kept the substance of the material but was shorter and used a more constrained vocabulary.

Corpus processing, model tuning, sampler tuning was a super iterative process. Took about three weeks of on and off work to get something i was happy with.

Hope you enjoy!

TRIP REPORT: VIENNA

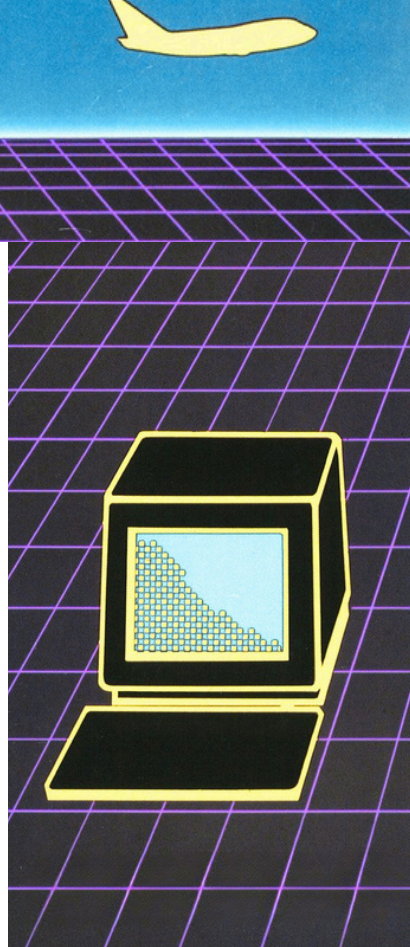

3722 sats \ 17 comments \ @leo 3 Jun Travel

Vienna is where I first heard about Bitcoin, even though I couldn't figure out how to buy any, or even run Bitcoin on my laptop. Fifteen years later adoption has not exactly swept the city, but there are a few places that accept Bitcoin, or at least claim they do.

☕ **Heine's:** My first stop is a cafe by Praterstern. I order the avocado toast, which is made with real bread, not toast, and a lemonade. I ask to pay in Bitcoin, and the waitress knows what to do, although she says it's typically her daughter's job handling Bitcoin. She has Wallet of Satoshi on her phone, but we first have to change the app's currency from USD to EUR, and I have to show her how to request a specific amount. I wonder if I should also show her the point-of-sale feature, but then I don't. The payment appears to go through immediately on my end, but takes a while to show up on her device. I wonder if it has to do with the move to the "self-custodial" Spark backend.

a big sign outside advertising Lightning payments, and another one inside by the counter. I'm confident this will work out somehow, so I have a look at the raincoats. After going through the collection I find one that isn't too expensive and fits me, and chat a bit with the sales staff, who assure me I can pay with Bitcoin. At the checkout I'm told that "Bitcoin doesn't work" and even as I offer to come back another day when it does, I'm told that they will not accept it. I say that in that case I cannot afford the coat. Both staff seem a bit bewildered by that and don't say anything, so I just slowly walk out of the store wishing them a good day. I'm disappointed, I kind of wanted that raincoat, but I also keep saving so much money because nobody wants my sats.

👤 **Teller Herrenmode** is a fine menswear department store in the 3rd district. They have

🍷 **Das Delicious** is a small restaurant and pub in Simmering. It seems to specialize in Yugoslavian and Austrian cuisine, and I order the čevapčići, which are great, except that they are served in a soup of mayonnaise. The palačinka is much better, served in vanilla sauce with nougat filling. There is a Bitcoin flag hanging outside, and a "Study Bitcoin" light installation inside. There is Bitcoin art on the wall, the bathroom door is covered in Bitcoin stickers and every menu emphasizes they accept Bitcoin. The Bitcoin ATM is not plugged in. I ask to pay with Bitcoin and the waiter immediately pulls an older phone from the bottom drawer behind the counter. He opens Wallet of Satoshi, but just shows the QR code with the Lightning address. I have to ask for my total bill, then have to look up the SAT/EUR exchange rate and send the funds from my Zeus wallet. Again the payment goes through right away, but it takes almost half a minute before it shows up on the recipient's device. Given the plenty of Bitcoin references in the restaurant I'm a bit disappointed at the poor checkout experience.

🍷 **Blue Bar** is a tiny bar tucked away in the old town. It has great charm, and as I ask to pay with Bitcoin I'm referred to the owner, who at first says he would prefer if I settled the entire bill at the end of my visit, then corrects himself "but you'll be paying with Lightning, right?" He is using Muun wallet, which is maybe not the ideal tool for the job, but he knows what he is doing and is very fast with generating the QR codes, which I then pay quickly. Muun doesn't make it obvious when a payment is coming in, so we always have to go back to the main menu. The owner is nonetheless very happy to get paid in sats, and raves about the payment speed and reliability. He said he has seen multiple card payments fail that day, but he hasn't seen a Lightning payment fail in weeks. I wonder what that means in absolute and relative numbers.

🏠 **Weltraum** is a new bar opened by a friend of mine. It's a bit of a maze with multiple rooms in the back, each decorated differently. I like the bar's retro-futuristic style and am lucky to get the chance to host a Bitcoin night there. With the help of Ben Arc and the LNbits team we configure two dedicated point of sale devices. We load the menu onto them for better records keeping, and set the devices to print out a receipt every time somebody orders food, as the food orders are passed to a restaurant nearby and delivered by hand. We also have a third point of sale running Numo, which allows us to accept cashu payments. Numo is quite neat, you can pay with cashu directly, or pay a Bolt11 invoice, which the device then swaps into cashu. The cashu tokens are kept on the device until a minimum threshold is reached, then they are swept to a pre-configured Lightning address. LNbits requires us to have our own node, but funds are never kept on the device. The devices also handle NFC payments very differently. On Numo a Bolt11 invoice can be directly written to the NFC reader, allowing you to "tap and pay" from wallets like Zeus. Through LNbits customers can pay either with Bolt card or by scanning the QR code, although hypothetically there is also the option to connect the LNbits terminal to a Stripe account and process card payments. Staff at the bar, which typically only handle cash payments, are quite happy with Lightning payments, their speed and ease of use. I buy a point of sale device for them and am optimistic they will continue to accept Bitcoin payments in the future.

<go to post for @leo's travel photos>
