NOTE FROM THE EDITOR

I attended a BitDevs Underground yesterday evening. You see, in my city, the infamous BitDevs meetup has been suspended for a time. And I understand the many factors working together that led to this decision. But think of it, right, there's a number of us nerds who can't accept the reality of not gathering monthly to discuss bitcoin development. So we've gone 'underground.' Zealots in an unwelcome atmosphere. Odds against us. But we still care about this thing.

go to plebpoet.com for more zines

When I am working on an email or I have to write something that I'm not quite sure how to phrase, I notice that "I could just throw it in Chat" flashes across my mental marquee.

Perhaps it is because I see so many people talking about using LLMs for this or for that, and it is clear that the wider world believes sincerely, deeply, childishly that LLMs *can* save them -- they can write the email. A draft at least. Probably come up with an outline or some stock phrases for how people say these things.

Why do I think of AI saving me if I don't actually believe it can save me? What I think is happening is that I don't like doing difficult things. This isn't new. I don't want to have to focus hard and think through how my words will be received. This is especially true when I'm writing something that is beyond my comfort zone -- where I'm unsure about what it is that I'm saying or asking.

I don't believe it can save me.

But, like a reverse of every religion on Earth, it impresses with daily miracles and doesn't seem to need my faith at all -- just my monthly subscription.

(and all my data)

For now, my attitude is one of resistance. I'm not going to take the easy path and have Chat write my complicated emails. It's possible I am become a noble savage, uncivilized, in the back eddy of progress.

I have yet to actually try this, because I don't believe that an LLM has any intuition and also I don't want my communications to sound like a greasy machine. Yet, the thought is there. For a fragment of a second, I look to AI to save me.

So, I look to AI, this great god in the sky, to save me.

HAS ANYONE PAID WITH BITCOIN YET?

2937 sats \ 69 comments \ @Undisciplined 13 Jun bitcoin

Today was my turn trying to pay with bitcoin at a Square merchant.

We ordered take out from a restaurant near us. I knew they used Square but we haven't eaten there since the bitcoin rollout. The online payment options didn't have bitcoin but I figured I could still ask about it when I went in to pick up our food.

There was no line, so I asked the cashier if anyone has paid in bitcoin yet. She said no and hadn't heard of that being an option. I told her that Square had supposedly enabled it on all their terminals.

This is a place we've eaten a bunch of times, so this was a friendly chat and I was just coming at it as someone who was curious about the situation. I asked her if we could try to figure out if it was an option and I'd buy a dessert if we found it. After we scrolled through the payment options (of which there are a bunch) looking for it, she told me the owner hasn't updated the system in a long time.

It was a little disappointing but I'll ask again next time and make the same offer of buying some pie or whatever if they can turn it on. The interaction was much less awkward than I expected (really not at all awkward). I think the curiosity angle will work well for me in the future.

Plenty of people advertising for things that people don't need... Overpriced shoes, fragrances, socks... "Collectibles"... "NFTs" (they're finally dead right?)

Very little advertising for things that actually benefit the people who buy them, as opposed to the companies who sell them. Spending bitcoin doesn't result in more advertising revenue, it doesn't bring more people to the 'crypto casino' to make exchanges the 'trading revenues'...

It doesn't make the ETF managers admin fees or a percentage... It doesn't help this credit card companies, it doesn't enrich the banks, it's not necessarily conducive to government spending (or lower bond yields...)

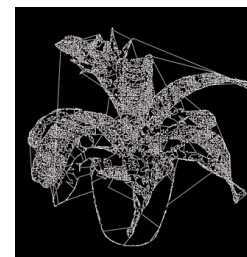

It's not particularly good for financial surveillance (or doesn't have to be) and bitcoin is highly, highly anti-leverage and historically sniffs out over-leverage like a bloodhound.

Being a better 'bond trader' doesn't get you more bitcoin... Nor does having an existing tech monopoly because you can borrow forever (see AI stonks).

Bitcoin is neutral money and spending it upsets ALL the EXISTING power structures, that's why there is so much pushback/anti-bitcoin rhetoric from existing authorities that don't want to lose their 'moat.'

EVERYONE has heard of the spacex IPO (if they have any interest in finance) but almost noone hears of Lightning - a growing and materially credible transactional layer for neutral value on the internet.

I don't think that's an accident.
Just my 2 sats

160 sats \ 14 replies \ @Jon_Hodl 14 Jun

I wouldn't spend my bitcoin at a Square merchant purely on principal. Either they accept bitcoin, directly on chain and/or to your own lightning wallet or I don't spend my sats with you.

Additionally, since Square is a KYC merchant, when you bitcoin with a offramp, you actually create even more valuable chain analysis data than when you just buy from a KYC platform.

THE NEW YORK KNICKS ARE 2025 - 2026 NBA CHAMPIONS!

22k sats \ 37 comments \ @BlokchainB 15 Jun Stacker_Sports history

I am STILL in disbelief.

I can't believe this is actually happening to me!! Being a sports fan all of my life I am used to my teams losing especially the dreadful Knicks.

And now we are here.
NBA CHAMPS!! NBA CHAMPS!!
Thank you Brunson for not being greedy in an age where every single player is putting money over winning. Leaving \$100M on the table couldn't have been easy but we got a championship out of it. Thank you for being humble!

...
Mike Brown thank you for using the regular season to build that team chemistry. Using bench players in February is much better formula for winning versus Tibbs doing it in the Eastern Conference Finals when the team is getting handled by the Pacers. I am so glad they moved on from "ground my players in to dust Tibbs).

And most important Leon Rose. He is the President who will go down in Knicks History as one of the best to ever do it. He didn't tank. He didn't wait for some superstar. Made good trades signed good players and built a team that won it all!!

So glad this happen. And to all my Knicks fans we can die happy now!!

WE GOT ONE!!!!
GO NEW YORK GO NEW YORK GO!
GOD BLESS AMERICA!!

THE CASE AGAINST BIP110

1554 sats \ 38 comments \ @anon 17
Jun bitcoin

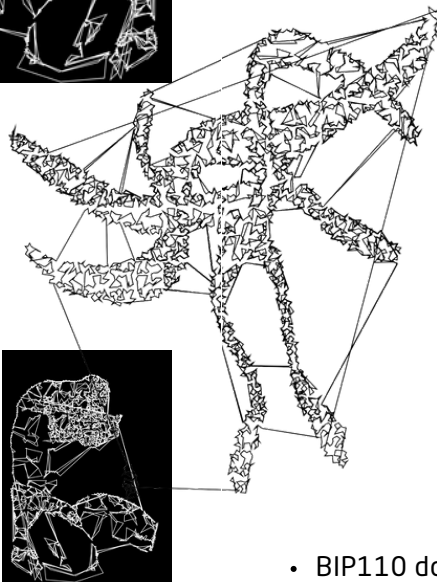

The Case Against BIP110
by Satonymous
2026-June-11 UTC

This is to state the case against BIP110, and to bring awareness to various identified vulnerabilities and flaws with the planned BIP110 chain.

There is an upcoming bitcoin fork known as BIP110 which takes place in August 2026. Although the miners signalling support for this is currently less than 1%, the supporters of BIP110 even if not the majority, are very outspoken online on their support for BIP110, much more so than those against BIP110. Support of BIP110 I am claiming mainly results from a lack of awareness of the truth, lack of adequate technical understanding of Bitcoin, and in believing fallacies as they are misled by well known influencers.

For if people knew the truth and knowledgeable, they would be against BIP110, which I am explaining here. I've been into Bitcoin from the very early days, and a long time cypherpunk, one cannot say that I am against Bitcoin's use for monetary purposes only, nor unknowledgeable about Bitcoin. I've seen this before and this feels very similar to the segwit battle and the resulting junk-coin which forked off of Bitcoin known as bcash. It is no coincidence that people with technical understanding of Bitcoin and technical competence are against BIP110. BIP110 support generally comes from people who are newer to Bitcoin or lack a technical understanding of Bitcoin.

The very short summary of this article is this. Being against BIP110 is not supporting spam. BIP110 does not fix anything as it claims to. BIP110 is a planned permanent hard-fork that will be incompatible with Bitcoin, instead of a temporary soft-fork as it claims to be. The BIP110 chain will have numerous flaws and vulnerabilities as detailed below. What I am saying here is not opinion but rather fact which can be verified.

A brief simplified explanation of BIP110, BIP110 is a set of new Bitcoin rules which define what transactions are and are not allowed. Its intent is to temporarily stop non-monetary spam transactions, and these restrictions are in place for one year after which the restrictions are lifted again. BIP110 would activate for nodes running BIP110 if at least 55% of mined Bitcoin blocks signal for BIP110 support, otherwise BIP110 nodes are hard-forking themselves in August 2026 regardless of miner support to create a new coin called BIP110-coin to compete with Bitcoin.

And now my case against BIP110 explained;

- Opposition to BIP110 is not supporting spam. The majority of BIP110 critics are not pro-spam, and the debate of BIP110 vs. anti-BIP110 is not a matter of pro-spam vs. anti-spam. Rather, critics of BIP110 are against it because they realize it does not fix anything as it claims to, and that it is being poorly implemented. This is a case of the claimed cure being worse than the problem itself. BIP110 supporters use fallacies that appeal to emotion rather than logic, combined with falsely framing the BIP110 debate as being pro-spam vs. anti-spam instead of whether BIP110 itself is a good idea or not. Even if BIP110 were a good idea, its implementation is flawed.

- BIP110 does not fix anything as it claims to.

Reason 1- BIP110 filters are only temporary. After a year of activation, BIP110-coin will be exactly like Bitcoin again for better or worse, except that BIP110-coin will be worth nothing or very little, and be incompatible with Bitcoin as a result of its own self-inflicted fork. Although the changes that BIP110 claims to do are temporary, the fork is permanent. This temporary implementation of the filters makes the permanent hard-fork pointless.

Reason 2- BIP110 does not actually stop spam. Someone already figured out how to spam a blockchain with images in a way that bypasses BIP110 filters. (source: knotslies DOT com)

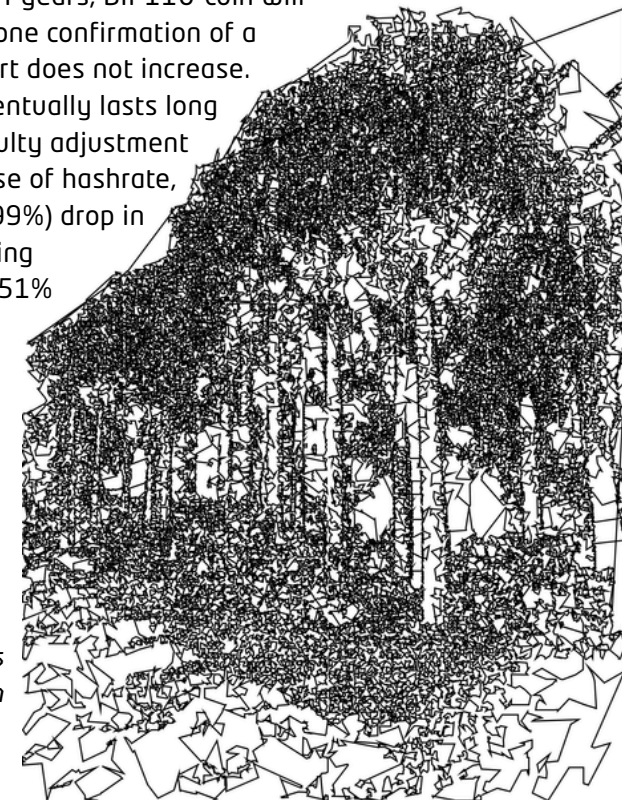

- BIP110 is a planned permanent hard-fork, not a temporary soft-fork. BIP110 promoters are misleading people.

CONTINUED

- BIP110 will be incompatible with Bitcoin after the fork.
- This will be problematic because when BIP110 users try to make Bitcoin payments, in their alternate reality they think they made a Bitcoin payment but they actually did not because they are on a different chain, they will end up losing their BIP110 coins. Likewise, if someone is using BIP110-coin and falsely saying they are accepting Bitcoin for payments, they will end up claiming that a sender did not send them payment when the sender actually did pay them (using Bitcoin). BIP110 users will have to choose to either keep using Bitcoin, or to use BIP110-coin due to the lack of replay protection. Without distinction between BIP110 chain and the Bitcoin chain being communicated by both the sender and recipient of a transaction, these described problems will come up. Bitcoin users will continue to call the non-BIP110 chain as Bitcoin, and so the only way forward is for BIP110 users to admit that BIP110 will be its own coin and to call it what it is, BIP110-coin. People who choose to use BIP110-coin will opt into a chain with no market cap, no value, and of no use as no known exchanges or businesses are planning on accepting BIP110-coin. BIP110-coin will also be incompatible with the current lightning network, and so BIP110-coin users would have to create their own new lightning network.
- BIP110 being a temporary set of filters, demonstrates a lack of technical confidence and a lack of testing. It was made temporary because of lack of confidence in the effects it may have.
- BIP110 is a scam.
- BIP110-coin and its supporters will falsely claim that their new coin is the real Bitcoin when it is not and will not be. This deception may even cause confusion to people and may cause people to be scammed out of their money by buying fake Bitcoin (BIP110-coin). BIP110-coin is a planned altcoin that is already trying to deceive people into thinking it is Bitcoin.
- Core did not make any changes to Bitcoin to allow for spam.
- Although this is unrelated to BIP110, I am mentioning this as an example of one of the many fallacies that many BIP110 supporters claim. Many BIP110 supporters think that maintainers of Core (Bitcoin's most popular node implementation) made new changes to the Bitcoin protocol rules to allow for spam. This is not true. There never was an OP_RETURN size limit for Bitcoin transactions, and Core did not remove the ability for nodes to set OP_RETURN size limits for transactions in their mempools. I'm not defending Core here, I'm just pointing out one of the many fallacies and misunderstandings that are used to get people to support BIP110.
- I personally do not support the removal of the default mempool policy limiting OP_RETURN though it still remains an option for nodes even if not the default. It is an error to say that Core removed the ability for nodes to control their mempool policy regarding OP_RETURN and that Core removed the OP_RETURN limit at the protocol level. But again, the scope of this article is not about Core vs. other implementations. Rather, it is about the flaws with the proposed solution known as BIP110.
- BIP110-coin will be on a broken and vulnerable minority chain with 4 identified vulnerabilities and flaws with the BIP110 chain.
- As of now, less than 1% of miners are signalling support for BIP110. In a few months BIP110 nodes will no longer acknowledge the majority of Bitcoin blocks and BIP110 nodes will only acknowledge BIP110 blocks. This means that BIP110 will become its own coin, BIP110-coin.
- 1: Because BIP110-coin has no planned abrupt difficulty adjustment, the difficulty requirement on BIP110-coin blocks will be significantly higher than the amount of hashrate on BIP110-coin. As a result, BIP110-coins blocks will take at least 16 hours on average to confirm assuming that BIP110-coin hard-forks with the current miner support of less than 1%. It will also take the BIP110-coin chain almost 4 years just to reach the difficulty adjustment period to bring the confirmation time of BIP110-coin transactions back down to 10 minutes. For nearly 4 years, BIP110-coin will take 16-17 hours just for one confirmation of a transaction if miner support does not increase.
- 2: Then if BIP110-coin eventually lasts long enough to reach the difficulty adjustment period without any increase of hashrate, it would be a significant (99%) drop in difficulty requirement making BIP110-coin vulnerable to 51% attacks, orphaned blocks, double spends, and transaction censorship.

[HM] - THE MAN WHO TURNED EVERYTHING INTO BITCOIN AND DISAPPEARED

11.9k sats \ 17 comments \ @guerratotal
18 Jun bitcoin BooksAndArticles history

**Daniel Fraga is one of two
most sought-after men in
Brazil, considered one
of the greatest men in
our country.**

With just a camera and a non-YouTube channel, it managed to make many BIG people uncomfortable and exposed, in fact, what happens under two steps of the system.

Even though he is considered one of the most dangerous men in Brazil, Daniel Fraga is also considered a hero by many, due to his courage in expressing his ideas and opinions.

There was a time when talking about Bitcoin in Brazil was synonymous with one thing: Daniel Fraga.

I don't say this as an exaggeration. I say this because it was literally the first. The first Brazilian YouTuber to record a video recommending the cryptocurrency. The first to explain to his audience what it was, why it mattered, why the traditional financial system's days were numbered.

And also, over time, he became something more difficult to describe: a symbol, a mystery, a legend that the internet itself built around him until it was no longer possible to separate the man from the story.

Daniel Alves Fraga was born on June 18, 1976, in the Bela Vista neighborhood of São Paulo.

He was a Linux systems administrator.

The most interesting thing is that this whole story began there in 2010, on the streets of São Paulo, with a super simple 43-second video.

< go to youtube >

Daniel decided to film an abandoned lot and post it on YouTube. In the video, he appears very indignant, not at all that in the description he had placed or straightened the premises and a state law that showed the failure of the government with what should be fulfilled, second to the constitution.

Of course he didn't stop there. I sell that other people also have the same problem, they started recording more and more videos.

...

Denúncia: mais entulho na rua Almirante Marques de
Leão - Bela Vista - São Paulo - SP
1,7 K visualizaciones · hace 16 años

Estátua viva com "bebê" na avenida Paulista
5,7 K visualizaciones · hace 16 años

At that time, all the videos followed the same objective: to show the failures of the state in its city and to criticize the role of politicians.

This was April 2010, when Daniel decided, for the first time, to attack a politician publicly, and the chosen one was the mayor of São Paulo at the time, Gilberto Kassab.

Praça Alexandre de Gusmão (ao lado do Trianon)
3,5 K visualizaciones · hace 16 años

The title of the video was: "Kassab does not monitor television and more wood is discarded as lixo."

It didn't take long for Daniel to face up and appear in front of the camera for the first time.

And guess what the critics are? Sim, he criticized Kassab again for the terrible administration in São Paulo. After he showed his face, he knew very well that here was a path without any problems and, even knowing this, he continued, for months, exposing the problems of the State.

More than that, in fact, Daniel Fraga stood out among so many on the internet due to his ideology, propagating and teaching anarcho-capitalism to the public.

As time went by, their videos, which previously only explained the state's faults, have now become an open revolt against the system.

He was the first Brazilian to declare himself an anarcho-capitalist on YouTube, in 2012, attracting thousands of people to that political philosophy that until then was practically invisible in the country.

CONTINUED

His videos mixed Austrian economics, criticism of the government and a direct, unfiltered way of speaking, which made many people uncomfortable.

That was exactly what he liked.

In December 2012, when Bitcoin was worth approximately \$13, he published what is considered the first YouTube video in Brazil recommending the cryptocurrency, titled "Bitcoin is better than the dollar."

Thirteen dollars. Today that seems like a joke. At the time, it was a bet that almost no one in the country was willing to take.

In the same year, 2012, a congresswoman named Cidinha Campos, from the PDT party, made several offensive remarks against Ricardo Gama, a blogger well-known for his criticism and denunciations of political figures, very similar to Fraga's criticisms.

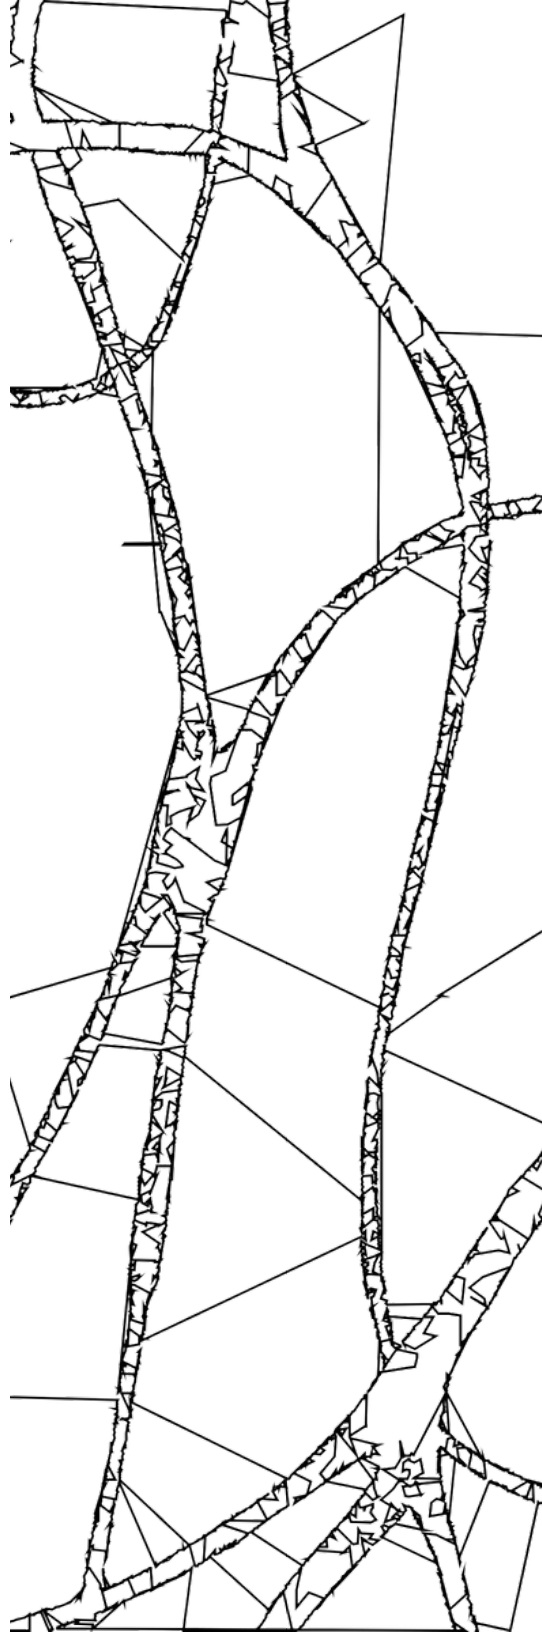

At that time, Ricardo, who had just suffered a near-fatal attack, also ended up facing a censorship process of his videos on YouTube, after responding to the criticisms and exposing a lot of the congresswoman's actions. And, of course, seeing a comrade in arms being bombarded by the State, Daniel Fraga went there and decided to support Ricardo, publishing two videos about the case, with many criticisms and insults against the PDT congresswoman.

Congresswoman Cidinha Campos, right away, didn't like it, and immediately counterattacked Daniel. First, she threatened him by exposing his mother's private data on Twitter. Second, she sued Fraga for moral damages.

If you think Daniel stopped there after this feud with Cidinha, you are totally mistaken.

Around the same time, he harshly criticized Alexandre Blanco, the PSDB candidate for mayor of São José dos Campos. However, this time, the candidate managed to censor some memes about him on Facebook through a court decision.

Fraga then made a video criticizing not only the candidate but also the judge who favored Blanco with the removal of the memes. This story didn't go unpunished. The judge filed a lawsuit against Fraga for slander and defamation, demanding the removal of that video.

Fraga reacted by asking his subscribers to download and share the video on their channels to ensure he wouldn't be silenced.

The judge, trying to intimidate Fraga, imposed a fine of 40,000 reais per day for non-compliance with the order to remove the video.

But by this point, it was too late for the State.

Fraga made a video claiming that the judge wouldn't get anything from him because he had already invested all his money in Bitcoin.

In this scenario, efforts to remove Fraga's videos from the internet were in vain, and the judge ended up archiving the case.

This made him something more than a controversial YouTuber. For many people within the Brazilian crypto ecosystem, Fraga became a living demonstration of what Bitcoin was for and beyond speculation.

In 2013, I created the first tutorials on Bitcoin in Brazil, explaining blockchain, decentralization, anonymity and how to buy cryptocurrency, when you first arrived in the country you knew what it was.

While others were looking at the price and wondering if it would go up or down, it explained why the system that was being replaced was broken since the foundations.

At some point during that time, he wrote, responding to a critic who told him that Bitcoin was a passing fad:

"In the future you will bitterly regret writing that. We'll see who laughs last."

Bitcoin was worth around \$100 at that time.

< continue reading online
about Fraga's mysterious
disappearance >
