1949 sats \ 20k boost \ 25 comments \ [@Hypno](#) 9 Oct bitcoin

Hi Stackers,

It's Hypno, been in Bitcoin since 2017, running nodes, playing with wallets, stacking sats, and trying to keep my seed phrase safe, actually. Last year, I needed a durable backup, but the metal options I was looking at were a hassle to set up, too expensive, or discontinued.

So I decided to build my own.

I'd never designed that kind of product before. So I learned CAD, experimented with 3D-printed jigs, and researched laser-cut metal. I wanted something simple: modular, tamper-evident, easy to stamp with basic tools, and built to last.

I made it for myself.

But once I realized how much work it took, and how many of us struggle with the same problem, I figured: if it works for me, why not for others too?

...

It's small. It's real. And it works.

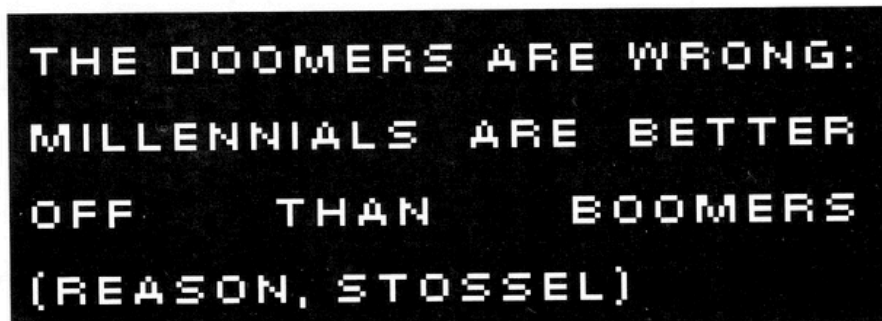

Seed Keys is live: [seedkeys.xyz](#)

The first product is a metal backup set, made from 316L stainless steel, with detachable keys, tamper seals, and a precision stamping jig. Available for single-signature and 2-of-3 multisig wallets.

The kit includes everything except the letter punch and hammer, both standard tools you can find locally, or may already own.

Starting small. Aiming to support sovereignty.
Feedback and questions welcome.

2521 sats \ 17 comments \ [@denlillaapan](#) 6 Oct econ

There was some statistical kerfuffle, I believe last summer(?), between publications in the FT and WSJ, claiming completely opposite results: young people are POORER than previous generations vs young people are RICHER than previous generations.

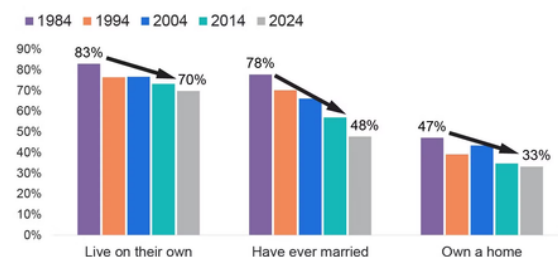

It all basically came down to uses of different price indices, highlighting how specific version of deflators like CPI matters not just on the margin for assessing what is and isn't happening in our (monetary) economies.

Here's John Stossel for Reason ridiculing all these silly online trolls who got it into their thick heads that young people are doing poorly:

One popular meme says when baby boomers like me were young, "A family could own a home, a car, and send their kids to college, all on one income." "That's a fantasy," says economist Norbert Michel. "We are much better off than we were." On social media, many young people say things like, "Most people don't live in houses because it's too expensive." Yes, homes cost more now, but census data show more Americans own their homes now than when I was a kid. And today's homes are much bigger and twice as likely to have central air, dishwashers, garbage disposals, etc.

which, of course is why we get graphs like these...

Percentage of US 30-Year-Olds Reaching 'Adult' Milestones

OOOPS, Messrs Stossel and Michel

No idea what figures they're looking at to reach these conclusions, honestly.

top post

The *following*, though, I actually believe is correct:

Today, Americans actually spend a smaller percentage of our money on food, clothing, and housing than we used to, according to Bureau of Labor Statistics survey data. Few people flew places for vacation. They didn't have the money, and flying cost much more. Adjusted for inflation, a cross-country flight cost \$1,000. Now it's about \$300. "People did not just go on vacation," says Michel, "did not fly all across the country."

"Gen Z, overall, is doing better than young people once did. A typical 25-year-old Gen Zer has annual household income that's 50 percent above Baby Boomers'."

Again, double-check the numbers (and price index deflators) on such claims.

Finally, yes, it's true—a family could own a car. But it wasn't anything like today's cars. It wasn't as safe or comfortable, and it broke down sooner. Today's cars last more than twice as long as cars did then.

OK fine, but SHOW ME the shitty cars I can buy? Oh, they're illegal bc regulations, and too gas-guzzling for California? Hm, ok, so *technically* they're cheaper but practically they're not...?...

I'm with the internet trolls and doomers on this one.

< *SHOW ME the shitty cars I can buy?*

I think that's the heart of the matter and why there's truth to what both camps are saying.

We are productive enough to afford to live like people did in the 50's, but it's f'ing illegal to do so.

The nice thing about this situation is that they could hypothetically just decriminalize that lifestyle.

"I'd quicker abandon bitcoin and go back to fiat!"

That stopped the whole conversation. In fact, it stopped the next conversation down the table as well. It kind of felt cathartic. I've wanted to say it for weeks, but the right conditions finally converged for the mountain to blow its top.

Now, mind you, this was in the context of drinking some beers and watching some rugby after a conference. It wasn't actually all that dramatic. I wasn't saying I'm going back to fiat. Nor was I dogging bitcoin. But I was trying to express that I consider myself an even bigger opponent of WhatsApp than of fiat. I stand by my refusal to use WhatsApp, no matter the price, as we bitcoiners likewise choose many inconveniences in a fiat era.

"Everyone in South Africa uses WhatsApp."

I assumed that meant a lot of people in South Africa use WhatsApp. I now am indeed convinced that EVERYONE in South Africa uses WhatsApp. Moreover, there is no discussion at all of potential concerns. It's been very inconvenient not using it, both for me and folks that need to communicate with me. I found this quirky at first, but it began to grate on me with more and more calls to, "just get WhatsApp." Discussion of the network effect of using WhatsApp over Signal or Telegram started to annoy me. Admiration of their business model actively frustrated me.

Fiat currently has a stronger international network effect than WhatsApp. I understand the average South African thinking that the network effect is important, but at the aforementioned hang, I was with hardcore bitcoiners. Even the, "Fix the money, fix the world" crowd didn't seem to understand why I didn't like this tool of the devil. I reminded them of Meta's track record on manipulating people and social irresponsibility, and the response was, "would you stop driving VW because someone hurt themselves being irresponsible with their car"? But the analogy fails. Volkswagen does not, 24 hours a day, 7 days a week, monitor my -

- Usage Data
- Search History

Most members of my family don't have that much on me...and this is just what they're admitting to tracking. So yeah, even though I don't know anyone that's died in a VW crash and I do know lots of people that turned into raging narcissists and sociopaths because of Facebook, if the tables were turned, I still wouldn't be as concerned (although I know cars are still tracking some of these things).

Empathy

Speaking of being a sociopath, or rather trying not to be one, here's the point. South Africans have bigger fish to fry. I am meeting lots of people here from Zimbabwe. Black or white, I haven't met a single person from Zimbabwe that doesn't instantly understand the purpose of bitcoin. Meanwhile, the South African rand is depreciating fast against the dollar, and that's not even really the biggest concern here. So I get why bitcoin is popular in this part of the world and Signal isn't such a big deal.

In the US, neither are really a big deal. If you know some journalists, you'll know some people into Signal. If you know some human rights activists (or let's face it, finance/crypto bros), you'll know some people into bitcoin. But SMS data is affordable to most Americans, and we all know people that turned into basket cases because of Facebook. So, just like I may need to work on my tolerance for WhatsApp users in SA, maybe we can all have a little more patience with no-coiners who still live in unpopped fiat bubbles. For every one that harasses you about getting with the program, there are assuredly a few that are gritting their teeth and bearing with the inconveniences of dealing with a person obsessed with freedom tech.

WIBE TOOLS.
NOT APPS

3518 sats \ 12 comments \ @optimism 7 Oct builders

And vibe them for you, because what the hell do you know about what other people want anyway?

We've entered a phase of world history where basic cognitive skill has become a commodity. You don't have to think, because you just let GPT do the thinking for you; in *thinking mode*. You don't have to do research, you just ask GPT to do the research for you, in *research mode*. You don't have to code, you just tell GPT to code for you, in *codex mode*. But you know what's really boring? Chatting with a fucking bot. And then you still gotta do all the boring, repetitive work on top.

So then what? *Let's build an app, get rich, sit back and chill!* Boring! And you're not going to get rich talking to GPT because everyone, their mom in law and their dog is talking to GPT. You can make an app now? Awesome, so can everyone else. You have no moat using a bot to do dumbass shit for you and then trying to sell it to people that can just ask GPT to build it themselves. And being rich is overrated anyway. Purpose is the game.

Let's assume that in 6 months from now you're still alive. This future self of yours is **an ignorant lazy bastard who doesn't give a shit about your genius today**, just like you are right now versus yourself 6 months ago. So fuck your idea. Don't waste your time on vibe coding the next big thing you just masturbated on your screen that you then have to sell to others. There is no market for ideas anymore because **any fool can do it**. What is there then, you ask? Making shit easy. **Everything is now bespoke**, and guess what else is bespoke? **Your problems**.

If you're set on vibe coding something, vibe together something that solves a problem **for you, right now**. Something that bothers the fuck out of you; I'm sure you have it, we all do. If you cannot pinpoint the frustration whatever thing you were just vibing is going to take away within 200 ms, leave it, it probably sucks. If it could take away pain, build a tool that takes it away, forever. **Pain-b-gone**.

Don't try to fix what is slowing me down, or what is slowing your buddy Jim down, fuck charity, it never works anyway. **You fix what slows you down**. Your future self won't even thank you, because there will be something else to fix. But at least you haven't wasted 6 months being boring af. Cuz you got them tools now, bro. And you've enabled and empowered yourself.

So when you open that vibe coding app / IDE / replit or whatever the kids made up last week, and you're wondering what to type, type your biggest problem. Break it down to what really bothers you about it. Build a tool to solve that, that you can use to kill that pain in your ass. And when you're done, it won't take long till you find something else to fix.

Apps are passé.

PS: sure, you can still share your vibed up tool with the world. But do you really want to be liable for others abusing shit you vibed up that you guaranteed don't want to understand?

WALLET OF SATOSHI IS
AVAILABLE IN THE US BUT
BALANCES AND
TRANSACTIONS ARE PUBLIC

3218 sats \ 10k boost \ 32 comments \ @k00b 8 Oct lightning

They released early today (they are based in Australia):

@walletofsatoshi

A new Bitcoin era begins now.

The world's best Lightning wallet, now self-custody.

Available worldwide today!

11:02 PM · Oct 7, 2025 · 186K Views

They are using Spark to provide customers with a lightning wallet. Spark is trustodial (h/t @justin_shocknet) but they've also made the weird choice of making all customer balances and transactions visible via a public explorer as pointed out by @theinstagibbs.

top post

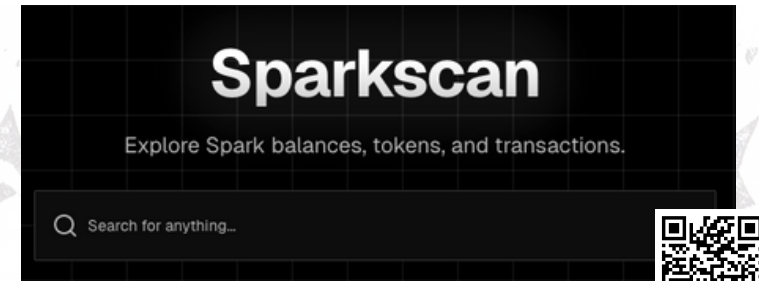

instagibbs

@theinstagibbs

Spark has made the decision that since there isn't real privacy against the Spark operators that everything should be searchable on a public index: sparkscan.io/?network=mainn...

Your Spark pubkey can be extracted from a single bolt11 invoice

This might not be a big deal if it were hard to determine a

receiver's Spark address, but any bolt11 paid to a Spark customer reveals the Spark address. @benthecarman has cooked up a utility to doxx the Spark address from any bolt11 invoice paying a Spark customer.

What this means: if you use WoS (or any other wallet using Spark), anyone you give a bolt11 to (which you do when you want to receive money) will be able to view **all** of your transactions and your account balance.

0 replies \ @k00b OP 9 Oct

Correction: some wallets using Spark (like Breez) do not expose the Spark address in the bolt11. However, given the public explorer and Spark address reuse, timing analysis can be used to deduce a wallet's Spark address and therefore its balance and history.

I BOUGHT A STICKER FROM A STRANGER ON A TROLLY WITH BITCOIN.

11.5k sats \ 11 comments \ @SatAttack 3 Oct bitcoin

A couple days ago I was on my way to school via the local public transit and while waiting for the trolley in the underground station a stranger approached me and my bench mate with a solicitation. He claimed to be a local artist who turns his stickers into art and sells them around town. The lady next to me quickly brushed him off but I saw a nice opportunity and asked him "have you considered accepting bitcoin for stuff like this?" His response was about as good as it gets. He said, "oh I'd love to accept it, but I don't know anything about." So, I covered the front of my pants and assured him that if he really was willing it was very easy to do, and I could show him how to do it.

The trolley started to roll in and I asked him where his stop was. Two stops after mine, which meant I had about 10 minutes to give him the pitch, download a wallet, then transact with each other. The whole experience was very nice because he was genuinely curious, non-combative, and inquired about the right things. We started by having him download blink wallet, which took a bit of our time because we had to wait for the trolley to exit the tunnel and get to a point where our mobile service would work again. Once we did it only took seconds without any prompting from me for him to get the wallet installed, set up, and ready to receive. Now it was time for a quick crash course.

I said to him: "ok a quick crash course on bitcoin before we settle." and he sat next to me with eager and open ears. I started with one of my favorite ways to introduce the concepts of Bitcoin the network and bitcoin the unit of account. Everyone now a days has heard the word "bitcoin" before but not many understand that when you say the word bitcoin, it could mean two different things. I quickly explained the Bitcoin network is made up of purely volunteers and stressed the fact that if you want to participate you don't need ID, permission, or accounts. I quickly mentioned one of my favorite parts of the network is how unimportant your sex, age, race, status, or geographical location is in order to be a part of it and quickly contrasted it with our current monetary and banking system.

From there I moved on to the lightning network. We talked about the peer-to-peer liquidity network that allows us to send and receive in a faster and cheaper way. We covered channels with some hypotheticals. If you and I want to transact often and freely, I said, we could use the Bitcoin network to establish a channel in between us and we could transact back and forth as often as we wanted and then settle later. Then I used the rest of the people on the trolley to paint a picture of the LN for him. "See that guy over there?" if I wanted to transact with him in a similar manner but didn't have a channel established with him while you did, I could then use our channel in order to do so. "So, If I have a channel established with you, I can also use it to transact with everyone that you have channels with." and he seemed to understand well enough. By this point we had about four minutes left, and it was time to actually transact. I walked him through the process and seconds later he owned his first ever bitcoin. I sent him 6170 Sats and he handed me my sticker. An Ewok in a Disneyland shirt and Mickey Mouse hat holding a churro. He claimed to have drawn "every single hair" himself on an iPad.

*... shortened for brevity. . .
use the QR code to catch the whole story*

Ten minutes is obviously a very short amount of time and I had to abruptly end our chat. I wanted to give him much more. Right away I wished I had the flyer @DarthCoin mentioned here: #1242288 it would have been a perfect situation to hand one over. I won't make that mistake again and have since printed a few out for the next time.

Bitcoin is thriving guys. The doom and gloom I see come through SN sometimes by @Solomonsatoshi or @denillaapan is just so so silly to me. SN is the only social media I use, so maybe it's just that I'm not being fire hosed by bitcoin twitter and its magnification of Bitcoin + fintech, but my optimism at this point is high. Fintech is the loudest, and with the most resources, but when we think of bitcoin adoption, they are the few, and they matter not. What really matters is individuals and if you are paying attention, forcing the right conversations in a polite and instructive way, or trying to spend your sats, you won't see it. And when I see rhetoric of "bitcoin is not used as MoE" I can't help but shake my head and laugh. The reality is though that many many many people are on the path to bitcoin even if they don't know it. The network isn't going anywhere. Humans have innate pattern recognition and although it may seem like a snails pace, the masses are gaining awareness. Every single person who accepts their first sats is a huge fucking deal in contribution to network effects. Be the chicken and the egg and you will get the results you want. It's happening all around us.
