Note from the Editor

I think I've decided to adopt a personal slogan. This choice is considered with great caution and care because I think slogans are dumb, mostly. But when you need to communicate something in a dumb way that takes no brain power to understand (and since everyone is busy off-loading their brain power to the computer), a slogan can be a handy thing. Here's mine:

Lightning Works.

New Gamified Bitcoin Education App

3309 sats \ 16 comments \ @NEEDcreations 4 Mar
news bitcoin bitcoin_beginners lightning Education

I created a fun app for people to learn about Bitcoin. There are organized channels, a level up ranking system, and an AI mascot (a buck named Nacho) that guides the user through the app.

<https://bitcoineducation.quest/>

The app also has a forum, marketplace, events page, media hub and a competitive PVP trivia mode that I'm still working on.

I'd appreciate any feedback / bugs you find.

No sign-in is required, but more features are open to you if you register.

Thanks for trying it out! - Phil

BTCPP Floripa 2026 - Hackathon Megathread

localprobe

Team:

- b10c - <https://github.com/0xb10c>

What We Built:

If your browser (Firefox does; Chrome/Brave/Edge are ok) leaks that are running a Bitcoin node (mainnet/testnets) on the same machine as your browser, localprobe alerts you about it by showing a privacy alert when you visit a website. Currently, <https://b10c.me> does (test by running [bitcoind -regtest](#) and visiting <https://b10c.me>). This leak might be used by e.g. advertisers to show you Bitcoin related ads.

Stack:

plain JS

Submission:

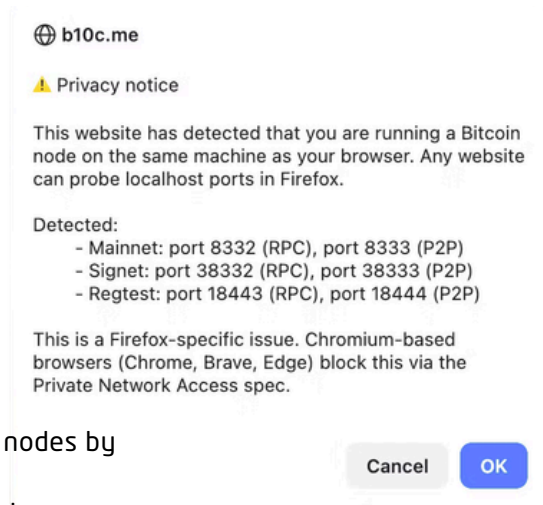

<https://loot.fund/hackathons/bitcoin-exploits-edition/applications/13>

Repo:

<https://gist.github.com/0xB10C/4e6b3d8394bb375323e887945091ead5>

Next Steps:

Using the same technique, we can actually harm remote Bitcoin nodes by DDoSing them from the browser. I've been working on a demo of this.

2 replies \ [@MurdawkAV](#) 28 Feb

Signal21

Team:

- murdawkmedia - github.com/murdawkmedia

What We Built:

The exploit at bitcoin++ isn't code – it's your calendar. The 40HPW meme exists because the Bitcoin rabbit hole is real: podcasts, YouTube channels, meetup streams, RSS feeds. Signal21 exploits that exploit back. Configure your sources and topics once, pay 21 sats, and get a single AI-synthesized audio briefing – deduplicated, filtered to what you actually care about, streaming to your browser before it's even done generating. Time is the only non-renewable resource. We built the reclaim button.

Stack:

- Backend: Python / FastAPI, async parallel feed fetching
- Transcription: yt-dlp + Gemini 2.5 Flash fallback (handles missing captions automatically)
- Script synthesis: Gemini 2.5 Flash via OpenRouter (reads thousands of lines, writes one broadcast-ready narrative)
- TTS: ElevenLabs streaming (zero-latency, audio starts before generation ends)
- Paywall: LNURL-pay via coinso.io – 21 sats to unlock a generation
- Frontend: Pure HTML/JS + Tailwind, cyberpunk aesthetic

Submission:

<https://loot.fund/hackathons/bitcoin-exploits-edition/application/create/new>

Repo:

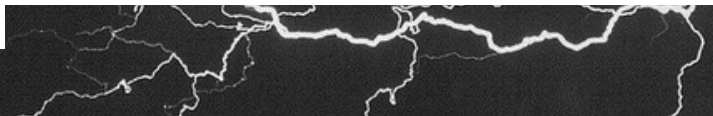

<https://github.com/murdawkmedia/signal21>

Next Steps:

- Persistent user feeds (save your sources, not just one-shot)
- Nostr integration – zap the clips you liked back to the original creator
- Mobile PWA
- Looking for: beta testers willing to pay 21 sats and tell us what sucks

Stealth – Bitcoin Wallet Privacy

Team:

- Breno Brito
<https://github.com/brenorb> <https://twitter.com/brenorb> brenorb@zaps.lol
- LordBabuino
npub1dkpmrtcuqlngclt27ftd8yec3vrmmxsehkqvq2l6uns64w4q656rqapwldjorge.x7@gmail.com x.com/JorgeSantanaDev
- Miranda
https://x.com/_hsmiranda <https://github.com/hsmiranda>
- Renato Britto
x.com/natobritto

What We Built (1-3 sentences):

Stealth is a local, read-only privacy auditor for Bitcoin wallets that analyzes UTXOs and detects privacy vulnerabilities such as address reuse, clustering signals, dust linkage, and exchange-origin fingerprints. It surfaces institutional-grade privacy insights directly to users without requiring private keys or sending data to third parties. Users can import a descriptor and immediately see where and how their privacy is exposed, along with actionable recommendations on how to improve their privacy.

Stack:

Bitcoin primitives: descriptors, UTXOs, transaction graph analysis

Backend: Java, Python, Quartus

Frontend: React, TypeScript

Node integration: Bitcoin node backend

Architecture: local-first, read-only privacy analysis engine

Landing page: Shakespeare

Submission:

<https://loot.fund/hackathons/bitcoin-exploits-edition/applications/8>

Repo:

<https://github.com/LORDBABUINO/stealth>

Next Steps:

- Mainnet support
- Expanded privacy heuristics (amount and timing fingerprinting)
- Interactive cluster visualization
- Wallet integrations for real-time privacy monitoring
- Transaction simulation to preview privacy impact before spending
- Mobile support
- Open-source release and ecosystem integrations

Minesploit

Team:

- Johnny - <https://github.com/johnnyasantoss> / Nostr
- Jayr - <https://github.com/jayrmotta>
- Lucas - <https://github.com/lucasbalieiro>

What We Built:

Security research framework for Bitcoin mining infrastructure. Hypothesis-first design: spin up a Stratum server, connect a real CPU miner, test your attack.

Example: `pool = StratumServer().start(); miner = CPUMiner(pool=pool).start();`

— now you're mining with real hashrate, ready to test your hypothesis.

While stress-testing Stratum V2 we found an interesting bug regarding share accounting (responsible disclosure in progress **).

Stack:

- Python 3.10+ (async/await, type hints, uv)
- Exploits: 18 CVEs (Bitcoin Core, Stratum, cgminer)
- Protocols: Stratum V1 client/server/MITM proxy/sniffer, Stratum V2 (translator), P2Pool scanner
- Utilities: TCP/SSL, JSON-RPC & mining message parsers, crypto (hash256/hash160/merkle), port scanner
- REPL: Interactive shell with check/run/verify, tab completion, scriptable
- CPUMiner: Docker-wrapped mujina for real hashrate testing

Repo:

<https://github.com/johnnyasantoss/minesploit>

Next Steps:

- More protocol implementations
- Stratum V2 bindings for easier testing
- Contributions welcome

2139 sats \ 3 replies \ [@anon](#) 28 Feb

EnergySats

Team:

- majoa10 - [@majoa10](#)

What We Built (1-3 sentences):

I built functional prototype that turns hotel and Airbnb energy savings into real Bitcoin. Guests earn satoshis for every appliance they keep off during their stay — paid out instantly via Lightning Network at check-out.

When a guest checks in through the app, a real-time energy savings meter starts running. Every appliance they choose to keep off — air conditioner, electric shower, TV, refrigerator — generates satoshis credited to their in-app balance.

At check-out, the guest withdraws their earned satoshis instantly via a Lightning Network payment — either by scanning a QR code from their wallet or pasting a BOLT11 invoice.

[PSI] Personal Sats Inflation, Part 4, Feb 2026

11.9k sats \ 10 comments \ [@unboiled](#)
2 Mar bitcoin_beginners

Intro

Starting October 2025, I began to track some of the items we buy at least a semi-regularly with sats. The idea is to visualize inflation in sats over time.

This is the 4th post of the series, documenting how our purchasing power changes for stuff we buy with sats. (Link to part 3, Jan 2026).

Background, Limitations

We've been spending & replacing for a few years. While we could feel things getting cheaper in sats over time, we didn't actually track and measure it for specific items. This is what these posts are about.

We spend a a few months of each year in South Africa where we can buy heaps of stuff with bitcoin. Towards the end of March, we'll head off to other countries for around half a year.

Meaning, next month's post will be the last one featuring real sats spent numbers for a while. That is, unless I stumble on other places where I can spend my sats.

For now, I am leaning towards continuing the series with a big fat asterisk by converting fiat numbers into sats. It feels wrong, so I'll mull it over a bit more.

My current thinking is I'd rather have continuity than sitting out the series for 6-7 months.

I'll make a call by the next post and declare it there.

The Numbers, Nao

Item	Date	Sats/Unit (Avg)	Change
Electricity	Jan	242.136	12.56%
	Feb	311.957	28.84%
Fuel	Jan	1429.050	4.40%
	Feb	1815.179	27.02%
Milk	Jan	1135.477	2.19%
	Feb	1462.874	28.83%
Phone Data	Jan	4657.885	3.84%
	Feb	6120.379	31.40%
Water	Jan	4657.188	-0.60%
	Feb	n/a*	n/a*

Units: Electricity in kWh, water in kilo liters, phone data in Gb, fuel and milk in liters.

*We didn't need to buy any more water in Feb, so no data.

Inflation in terms of sats has been fairly high again, despite the short breather in pace during the past month.

This is expected. As is a return to deflation at some point, some time in the future.

Summary

Seeing sats price inflation isn't surprising since things are still priced in shitcoins. Yes, the very ones that now buy more Bitcoin than in the months prior.

And that might go on for a few more months or who knows? We might also see sats price deflation next time around. Only time will tell. And I'll be here to tell the tale.

On the plus side, we've been doing this for almost 4 years now. So at least we know things are getting cheaper in the long-enough-run. :)

A response to Darthcoin on ideological purity in Bitcoin

3983 sats \ 74 comments \ @MattAhlborg0
4 Mar AI bitcoin lightning

As some of you may know, my company PayPerQ (PPQ.AI) accepts Bitcoin along with altcoins, stables, and even credit cards. I came across this post today by Darthcoin, who regularly throws shade on Bitcoin companies that do not pass the purity test. This was my response to him. I hope we can drum up some great conversation from here!

PayPerQ
payperq@nostr.lol

It's almost as if maintaining 100% ideological purity is a terrible business decision, and followingly, a terrible decision for spurring on further Bitcoin adoption.

PayPerQ:

- Hold a BTC treasury
- Accepted 1/3rd of its investment in BTC.
- Pays salaries in BTC
- Offers a discount when paying via Lightning
- Sells all altcoins accepted to pay bills, holds onto as much BTC as possible.
- Runs its own lightning node
- Is paid by two of its gift card partners in BTC
- Serves as its own sovereign merchant via BTCPayServer
- Sends out creator payments via the lightning network.
- Regularly pushes forward various new lightning tech and discussion.
- Earns BTC interest on cash reserves via River.com.

I'm being honest when I say that if PPQ was "Bitcoin only" in its full form, we would no longer be in business. Competitors accepting stables and altcoins would have swallowed us up by now.

Be "Bitcoin-first" like us, don't be "Bitcoin-suicidal" like Darthcoin!

P.S. I very much respect the work that you've done over the years. I have personally benefited from your educational materials!

DarthCoin B darthcoin@stacker.news | 1 hr.

[\[meta alert\]](#)

Yo, I wonder something kinda meta: why are you triggered by this to a point that you publish a reply from your company account? You run a prepaid service (awesome[1]) that has since as far as my memory goes back always incentivized using LN. You're not a wallet - just like SN isn't a wallet - so why do you and your company feel so strongly about what Darth says about wallet purity? Why enter this fight? Is this a hill to die on?

1. You have an awesome service. I use it because you provide a really great range of LLMs that serve me in testing things out. I recommend your service to people and I also recommend them to use LN and take the 5% discount.

What's driving Bitcoin Business and Merchants adoption in 2026?

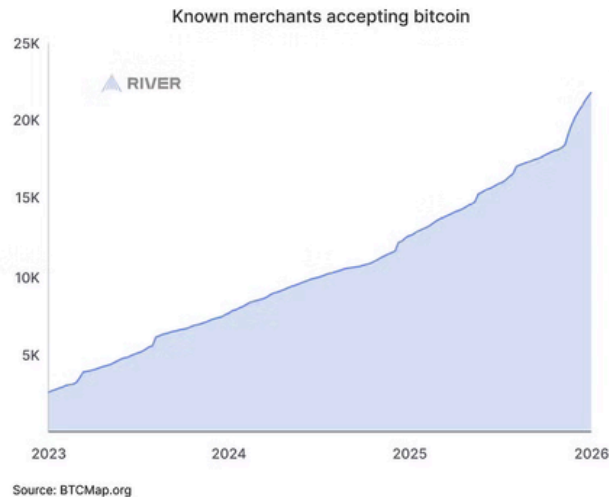

13.2k sats \ 20 comments \ @supratic 5 Mar AGORA

This slides are part of latest River Intelligence report about What's driving Bitcoin and Lightning adoption in 2026.

Continue reading the report for Bitcoin public adoption

Continue reading the report for Lightning

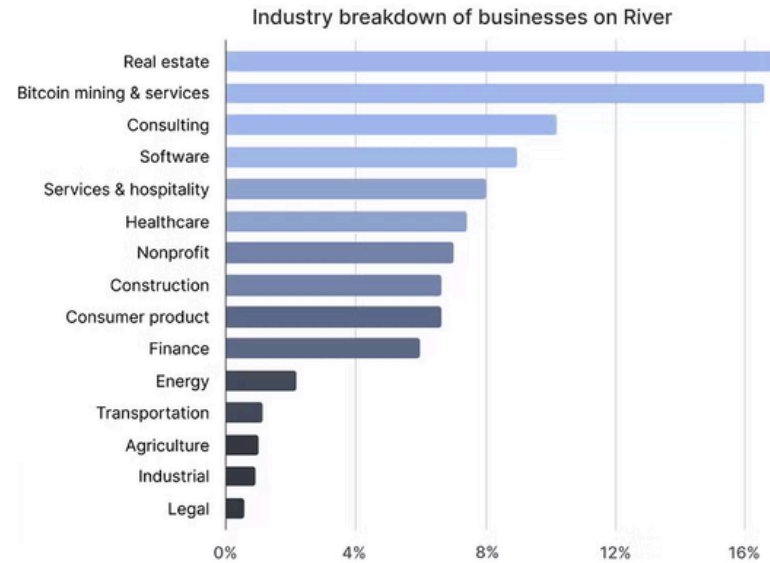

There is no bear market in bitcoin adoption

Trust in bitcoin has grown faster than that of any asset in history. What began as an experiment is now a globally recognized store-of-value, with adoption patterns that rival the internet.

Bitcoin is now held by millions of individuals, thousands of businesses, and several dozen governments around the world. This report examines the key Bitcoin adoption trends over the past year.

We show that even in a period when bitcoin's price declined, adoption continued to accelerate.

Lightning methodology to determine transactions and volume

Due to the architecture of the Lightning Network, an outside observer can't determine exactly how many transactions are happening on the network.

Our estimates are derived by aggregating data from many large nodes within the network. To ensure accuracy, we first adjust this data downward to account for overlapping transactions before extrapolating to arrive at network-wide estimates.

Our November 2025 dataset was made possible by 11 data providers, representing 50.6% of Lightning Network capacity.

Based on the transaction data received, we estimated that 31.0% of all transactions overlapped, necessitating a downward adjustment of 15.5% to both the total transaction count and volume.

After applying this

adjustment, we extrapolated the refined dataset

to cover the remaining 49.4% of the Lightning Network's capacity not included in our data.

River's 2023 Lightning Network Report provides an expanded explanation of our methodology and how the Lightning Network works.
